A. Correct Magnetic bearing could  
not be had on account of local  
attractions all along the line. At  
a few places in the large flats where  
there were no surface rocks there  
was no apparent disturbance of  
the needle. and the bearing of the  
bearing

indicated by needle was at an average of 10°45'E. The line run by me is a transit-line, as I kept front and back sights all the time

Surveyed during the month of August 1890.
