PREFACE,

BY THE ENGLISH EDITOR.

SINCE the annexation of Louisiana to the United States of America, in the year 1803, the government of the latter country has turned its attention, on several successive occasions, to obtain an accurate knowledge of the new territory, with a view to ultimate objects of colonization and commerce; and the judicious measures it has pursued, besides answering the purposes to which they were more immediately directed, have resulted in geographical discoveries of great importance.

In 1805, a party under the command of Lieutenant Pike, a young officer of bold and enterprising spirit, was ordered to explore the Upper Mississippi, by ascending along the

whole of its channel from its confluence with the Missouri to its source. This expedition sailed from St. Louis on the 9th of August, 1805, and returned to the same place on the 30th of April, 1806, after successfully accomplishing the design of its appointment.

In the course of the same year, Lieutenant Pike was chosen to the command of another expedition destined to explore the interior districts of Louisiana, lying to the southward of the Missouri. He was instructed to ascend the Great Osage River to its source; then to proceed towards the Arkansaw: here he was to detach a party, under the command of Lieutenant Wilkinson, to descend this river as far as the Mississippi; while himself, with the rest of his men, ascended to its source. After visiting its head-waters, he was directed to seek the source of the Red River, and to follow that stream to Natchitoches. The former part of this plan he executed agreeably to his orders: but being bewildered in the snowy regions at the head of the Arkansaw, he advanced too far to the westward, and struck the great River del Norte, within the Spanish boundary. He was here arrested by a detachment of Spanish troops, and carried

prisoner to the capital of New Mexico; whence, after a detention of a few months, he was conveyed by a circuitous route along the shores of the Gulph of Mexico towards the boundary of the province, on the road to Natchitoches. Lieutenant Pike departed from St. Louis on this expedition, July 15, 1806, and returned July 1, 1807.

The interesting narrative of these two journies was published in England, in the year 1811, by the present Editor, who had been furnished with an authorized copy of the original manuscript. Mr. Pike's Travels were of considerable importance in a geographical view. The sources of the Mississippi were before known, and their geographical position accurately ascertained from preceding observations; but its progress, down to its junction with the Missouri, had never been examined, except at a few places which had been casually visited by Indian traders. Mr. Pike explored the whole of this portion of its channel, and laid it down from actual survey; and by correcting his admeasurements by astronomical observations, was enabled on his return to form a correct Map of its course, which has been given on a reduced scale with

his printed Journal. By pursuing the same laborious plan, of surveying his route, in his second Tour, he has been able to furnish the first satisfactory account of the Great Osage River, and of the upper portion of the Arkansaw, from about latitude 35° north, to its source, about latitude 42° ; and also of the general course of the Rio del Norte of New Mexico. He visited likewise a part of the river Kansas, and discovered the head-waters of the Platte, another large stream which flows into the Missouri. The lower portion of the Arkansaw, from the point whence Mr. Pike ascended, was explored during this expedition by Lieutenant Wilkinson, whose Journal is printed in Mr. Pike's Work.

The countries traversed by Mr. Pike, especially during his last Tour, were almost as little known to the world as the interior of Africa. French traders had, it is true, penetrated through a considerable portion of them; but as in almost every instance their objects were merely commercial, their knowledge was carefully kept to themselves, and perished with them. An exception ought indeed to be made in the case of Du Pratz, whose work on Louisiana displays consider-

able talent for observation, and whose statements, as to its geographical features, have in general been corroborated by subsequent surveys. After all, however, the courses of the great rivers were but very partially ascertained, and all the maps of this district were in consequence grossly erroneous. These defects have been in a great degree rectified by Mr. Pike's Charts, which have supplied materials for an excellent Map of this portion of the American Continent.*

Besides these great undertakings, other expeditions on a smaller scale were directed to the examination of particular districts. Among these may be mentioned, a Journey performed in the latter part of the year 1804, by Mr. Dunbar and Dr. Hunter, with a party under their

* It is greatly to be lamented, that this enterprising traveller, whose humane attentions to the men under his command, during his several journies, were as conspicuous as his fortitude and resolution in surmounting the difficulties he had every where to encounter, should have fallen a sacrifice in the present unhappy contest between this country and America. Being rewarded for his services with the rank of General, he was appointed to a command in the army destined to act against Canada, and lost his life by an accidental explosion, which blew up a fort in which he was stationed.

direction, who ascended the Washita River, an interesting stream flowing from the north-west, and emptying its waters into the Red River of Louisiana, a few miles above the confluence of the latter with the Mississippi. It was intended that the examination of the Red River itself should be entrusted to Mr. Pike, who, after completing his survey of the upper part of the province, was to descend along its channel on his return. But, previously to this period, some account of it had been drawn up by Dr. Sibley, of Natchitoches, who had himself explored it for a considerable distance, and obtained his information respecting the upper part of its course from a respectable native trader, who had passed his life in the neighbourhood. This account, together with Mr. Dunbar and Dr. Hunter's descriptions of the Washita, were transmitted to the President of the United States, and by him communicated to Congress in the year 1806. They were afterwards published by the government, with some other official Documents of a similar kind.

But the most important expedition of discovery fitted out by the government of the United States, was that entrusted to the com-

mand of Captains Lewis and Clarke*; who were directed to explore the river Missouri

** The following Message on the subject of this Expedition was delivered to Congress by the President of the United States, in the Year 1806.*

TO THE SENATE AND HOUSE OF REPRESENTATIVES OF THE UNITED STATES.

In pursuance of a measure proposed to Congress by a message of January 18th, one thousand eight hundred and three, and sanctioned by their approbation for carrying it into execution, Captain Meriwether Lewis, of the first regiment of infantry, was appointed, with a party of men, to explore the river Missouri, from its mouth to its source, and crossing the highlands by the shortest portage, to seek the best water communication thence to the Pacific ocean; and Lieutenant Clarke was appointed second in command. They were to enter into conference with the Indian nations on their route, with a view to the establishment of commerce with them. They entered the Missouri May 14th, one thousand eight hundred and four, and on the 1st of November took up their winter quarters near the Mandan towns, 1609 miles above the mouth of the river, in latitude $47^{\circ} 21' 47''$ north, and longitude $99^{\circ} 24' 45''$ west from Greenwich. On the 8th of April, one thousand eight hundred and five, they proceeded up the river in pursuance of the objects prescribed to them. A letter of the preceding day, April 7th, from Captain Lewis, is herewith communicated. During his stay among the Mandans, he had been able to lay down the Missouri, according to courses and distances taken on his passage up it, corrected by frequent observations of longitude and latitude; and to add to the actual survey of this portion of the river, a general map of the country between the Mississippi and Pacific, from

from its confluence with the Mississippi to its source — to proceed thence across the moun-

the thirty-fourth to the fifty-fourth degrees of latitude. These additions are from information collected from Indians with whom he had opportunities of communicating, during his journey and residence with them. Copies of this map are now presented to both houses of Congress. With these I communicate also a statistical view, procured and forwarded by him, of the Indian nations inhabiting the territory of Louisiana, and the countries adjacent to its northern and western borders; of their commerce, and of other interesting circumstances respecting them.

In order to render the statement as complete as may be, of the Indians inhabiting the country west of the Mississippi, I add Dr. Sibley's account of those residing in and adjacent to the territory of Orleans.

I communicate also, from the same person, an account of the Red river, according to the best information he had been able to collect.

Having been disappointed, after considerable preparation, in the purpose of sending an exploring party up that river, in the summer of one thousand eight hundred and four, it was thought best to employ the autumn of that year in procuring a knowledge of an interesting branch of the river called the Washita. This was undertaken under the direction of Mr. Dunbar, of Natchez, a citizen of distinguished science, who had aided, and continues to aid us, with his disinterested and valuable services in the prosecution of these enterprises. He ascended the river to the remarkable hot springs near it, in latitude $34^{\circ} 31' 4''$.16, longitude $92^{\circ} 50' 45''$ west from Greenwich, taking its courses and

tains, by the shortest route, to the first navigable water on the western side, which they

distances, and correcting them by frequent celestial observations. Extracts from his observations, and copies of his map of the river, from its mouth to the hot springs, make part of the present communications. The examination of the Red river itself is but now commencing.

TH. JEFFERSON.

February 19, 1806.

Extract of a Letter from Captain Meriwether Lewis, to the President of the United States, dated

DEAR SIR, Fort Mandan, April 17th, 1805.

Herewith enclosed you will receive an invoice of certain articles which I have forwarded to you from this place. Among other articles, you will observe, by reference to the invoice, 67 specimens of earths, salts, and minerals, and 60 specimens of plants; these are accompanied by their respective labels, expressing the days on which obtained, places where found, and also their virtues and properties, when known. By means of these labels, reference may be made to the chart of the Missouri, forwarded to the Secretary of War, on which the encampment of each day has been carefully marked: thus the places at which these specimens have been obtained may be easily pointed out, or again found, should any of them prove valuable to the community on further investigation.

You will also receive herewith enclosed, a part of Captain Clarke's private journal; the other part you will find enclosed in a separate tin box. This journal will serve to give you the daily details of our progress and transactions.

were to follow as far as the shores of the Pacific Ocean. This party entered the Missouri

I shall dispatch a canoe with three, perhaps four, persons from the extreme navigable point of the Missouri, or the portage between this river and the Columbia river, as either may first happen. By the return of this canoe, I shall send you my journal, and some one or two of the best of those kept by my men. I have sent a journal kept by one of the sergeants, to Captain Stoddard, my agent at St. Louis, in order, as much as possible, to multiply the chances of saving something. We have encouraged our men to keep journals, and seven of them do, to whom, in this respect, we give every assistance in our power.

I have transmitted to the Secretary at War, every information relative to the geography of the country which we possess, together with a view of the Indian nations, containing information relative to them, on those points with which I conceived it important that the government should be informed.

By reference to the muster rolls forwarded to the war department, you will see the state of the party; in addition to which, we have two interpreters, one negro man, servant to Captain Clarke; one Indian woman, wife to one of the interpreters; and a Mandan man, whom we take with a view to restore peace between the Snake Indians, and those in this neighbourhood, amounting, in total with ourselves, to thirty-three persons. By means of the interpreters and Indians, we shall be enabled to converse with all the Indians that we shall probably meet with on the Missouri.

I have forwarded to the Secretary at War my public accounts, rendered up to the present day. They have been

on the fourteenth of May 1804, and took up their winter quarters on the first of the en-

much longer delayed than I had any idea they would have been, when we departed from the Illinois: but this delay, under the circumstances in which I was compelled to act, has been unavoidable. The provision perioque and her crew, could not have been dismissed in time to have returned to St. Louis last fall, without evidently, in my opinion, hazarding the fate of the enterprise in which I am engaged; and I therefore did not hesitate to prefer the censure that I may have incurred by the detention of these papers, to that of risking, in any degree, the success of the expedition. To me, the detention of these papers has formed a serious source of disquiet and anxiety; and the recollection of your particular charge to me on this subject, has made it still more poignant. I am fully aware of the inconvenience which must have arisen to the war department, from the want of these vouchers, previous to the last session of congress, but how to avert it was out of my power to devise.

From this place we shall send the barge and crew early to-morrow morning, with orders to proceed as expeditiously as possible to St. Louis; by her we send our dispatches, which I trust will get safe to hand. Her crew consists of ten able-bodied men, well armed, and provided with a sufficient stock of provision to last them to St. Louis. I have but little doubt but they will be fired on by the Sioux; but they have pledged themselves to us that they will not yield while there is a man of them living. Our baggage is all embarked on board six small canoes, and two perioques; we shall set out at the same moment that we dispatch the barge. One, or perhaps both of these perioques, we shall leave at the Falls of the Missouri, from whence we intend

suings November in the country of the Mandan Indians, having by computation proceeded

continuing our voyage in the canoes, and a perioque of skins, the frame of which was prepared at Harper's ferry. This perioque is now in a situation which will enable us to prepare it in the course of a few hours. As our vessels are now small, and the current of the river much more moderate, we calculate upon travelling at the rate of 20 or 25 miles per day, as far as the Falls of the Missouri. Beyond this point, or the first range of rocky mountains, situated about 100 miles further, any calculation with respect to our daily progress, can be little more than bare conjecture. The circumstance of the Snake Indians possessing large quantities of horses, is much in our favour, as by means of horses the transportation of our baggage will be rendered easy and expeditious over land, from the Missouri to the Columbia river. Should this river not prove navigable where we first meet with it, our present intention is, to continue our march by land down the river, until it becomes so, or to the Pacific ocean. The map, which has been forwarded to the Secretary of War, will give you the idea we entertain of the connexion of these rivers, which has been formed from the corresponding testimony of a number of Indians, who have visited that country, and who have been separately and carefully examined on that subject, and we therefore think it entitled to some degree of confidence. Since our arrival at this place, we have subsisted principally on meat, with which our guns have supplied us amply, and have thus been enabled to reserve the parched meal, portable soup, and a considerable proportion of pork and flour, which we had intended for the more difficult parts of our voyage. If Indian information can be credited, the vast quantity of game with which the country abounds through which we are to pass, leaves us but little to apprehend from the want of food.

1609 miles. They resumed their voyage on the seventh of April 1805, and on the eigh-

We do not calculate on completing our voyage within the present year, but expect to reach the Pacific ocean, and return as far as the head of the Missouri, or perhaps to this place, before winter. You may therefore expect me to meet you at Montachello in September, 1806. On our return we shall probably pass down the Yellow Stone river, which, from Indian information, waters one of the fairest portions of this continent.

I can see no material or probable obstruction to our progress, and entertain, therefore, the most sanguine hopes of complete success. As to myself, individually, I never enjoyed a more perfect state of good health than I have since we commenced our voyage. My inestimable friend and companion, Captain Clarke, has also enjoyed good health generally. At this moment every individual of the party is in good health and excellent spirits, zealously attached to the enterprise, and anxious to proceed; not a whisper of discontent or murmur is to be heard among them; but all in unison act with the most perfect harmony. With such men I have every thing to hope, and but little to fear.

Be so good as to present my most affectionate regard to all my friends, and be assured of the sincere and unalterable attachment of

Your most obedient servant,

MERIWETHER LEWIS,

Captain of the 1st U. S. Regiment of Infantry.

TH. JEFFERSON,

President of the United States.

teenth of August reached the extreme navigable point of the Missouri, upwards of 3000 miles from its mouth. They here procured

See a Pamphlet, intituled "*Message from the President of the United States, communicating Discoveries made in exploring the Missouri, Red River, and Washita, by Captains Lewis and Clarke, Doctor Sibley, and Mr. Dunbar; with a Statistical Account of the Countries adjacent. Read in Congress, February 19, 1806.*" New York, printed, 1806.

The principal part of Captain Lewis's Statistical View of the Indian Nations of Louisiana, together with Dr. Sibley's Account of the Indians on the Arkansaw, &c. and Mr. Dunbar and Dr. Hunter's Account of the Washita River, all referred to in the above communication, were published in England, in an Octavo Volume, intituled "*The Travels of Captains Lewis and Clarke, from St. Louis, by way of the Missouri and Columbia Rivers, to the Pacific Ocean; performed in the Years 1804, 1805, and 1806, by Order of the Government of the United States; containing Delineations of the Manners, Customs, Religion, &c. of the Indians, compiled from various authentic Sources, and original Documents, and a Summary of the Statistical View of the Indian Nations, from the official Communication of Meriwether Lewis.*" London, 1809.

As far as relates to Lewis and Clarke's Travels, this work is not, however, what it pretends to be, for it contains no farther account of them than was given in the above message, and some private letters of Captain Clarke, addressed to his friends before and after his return. But, in other respects, it is of considerable value, the other documents inserted in it being curious, and contained in no other English publication.

horses, and crossed the dividing chain of mountains for a distance of more than sixty miles, and having reached a navigable stream, descended in canoes to the mouth of the great Columbia River, which they reached on the fifteenth of November. They passed the winter among the Indians on the coast of the Pacific. On the 27th March, 1806, they set out on their return, and reached St. Louis on the 23d of September following, after having travelled in all, by computation, nearly 9000 miles!

The work which is here given to the public, contains the official Journal of this extraordinary and interesting Journey; the importance of which, to geographical science, will readily be estimated by those who are acquainted with the glaring imperfections of the best Maps hitherto published of the countries that are here described. As every reader will have the opportunity of judging for himself, it were superfluous to say any thing in this place as to the admirable address, the discretion, perseverance, and intrepidity, which were on all occasions evinced by the commanding officers throughout the whole of their long, hazardous, and fatiguing route, during which

they proved themselves eminently qualified for the important trust which had been committed to them in charge.

The Tour which is here detailed, was terminated in the autumn of 1806; but the Journal, though repeatedly announced, was not published before this year*. Part of the delay was probably occasioned by the death of Captain Lewis, in consequence of which the whole labour of preparing the manuscript for the press devolved on his intelligent associate, Captain Clarke. The present edition is printed nearly verbatim from the original; the sheets of which were forwarded to this country by the American Proprietors: the only liberty that has been taken with the language, has been

* In the year 1808, an account of this expedition was published in an octavo volume by Patrick Gass, a sergeant attached to the exploring party. The officers had encouraged the men to keep journals, in order to multiply the chances of communicating information of their progress to the government, in case of accident. This work is founded on one of these private journals. It exhibits a plain statement of the transactions of each day, with occasional remarks on the country and the inhabitants, which are in general sensible and judicious. Its interest is not wholly superseded by the publication of the official Narrative, as it contains some particulars not noticed in that, and serves at the same time to authenticate its details.

merely the correction of a few inadvertent grammatical or typographical errors. The American Copy contained an Appendix drawn up by Captain Lewis on the state of the Indian Nations; with hints for their future government, and for the regulation of the commercial intercourse between them and the United States; but as the subject is altogether of a local nature, and the observations possess little interest for the British reader, it has been omitted.

THOMAS REES.

THE PARTY SET OUT ON THE EXPEDITION AND PASS WOOD RIVER — DESCRIPTION OF THE TOWN OF ST. CHARLES — OSAGE WOMAN RIVER — GASCONADE AND OSAGE RIVERS DESCRIBED — CHARACTER OF THE OSAGE INDIANS — CURIOUS TRADITIONARY ACCOUNT OF THEIR ORIGIN — THE PARTY PROCEED AND PASS THE MINE RIVER — THE TWO CHARATONS — THE KANZAS, NODAWA, NEWAHAW, NEESH-NABATONA, LITTLE NEMAHAR, EACH OF WHICH ARE PARTICULARLY DESCRIBED — THEY EN CAMP AT THE MOUTH OF THE RIVER PLATTE — A PARTICULAR DESCRIPTION OF THE SURROUNDING COUNTRY — THE VARIOUS CREEKS, BAYS, ISLANDS, PRAIRIES, &c. GIVEN IN THE COURSE OF THE ROUTE.

ON the acquisition of Louisiana, in the year 1803, the attention of the government of the United States, was early directed towards exploring and improving the new territory. Accordingly, in the summer of the same year, an expedition was

VOL. I.

B

planned by the president for the purpose of discovering the course and sources of the Missouri, and the most convenient water communication thence to the Pacific Ocean. His private secretary, Captain Meriwether Lewis, and Captain William Clarke, both officers of the army of the United States, were associated in the command of this enterprize. After receiving the requisite instructions, Captain Lewis left the seat of government, and being joined by Captain Clarke at Louisville, in Kentucky, proceeded to St. Louis, where they arrived in the month of December. Their original intention was to pass the winter at La Charrette, the highest settlement on the Missouri. But the Spanish commandant of the province, not having received an official account of its transfer to the United States, was obliged, by the general policy of his government, to prevent strangers from passing through the Spanish territory. They therefore encamped at the mouth of Wood river, on the eastern side of the Mississippi, out of his jurisdiction, where they passed the winter in disciplining the men, and making the necessary preparations for setting out early in the Spring, before which the cession was officially announced. The party consisted of nine young men from Kentucky, fourteen soldiers of the United States army who volunteered their services, two French watermen, an interpreter and hunter, and a black servant belonging to Captain Clarke—all these, except the last, were enlisted to serve as privates during the

expedition, and three sergeants were appointed from amongst them by the captains. In addition to these were engaged a corporal and six soldiers, and nine watermen to accompany the expedition as far as the Mandan nation, in order to assist in carrying the stores, or repelling an attack, which was most to be apprehended between Wood river and that tribe. The necessary stores were subdivided into seven bales, and one box, containing a small portion of each article in case of accident. They consisted of a great variety of clothing, working utensils, locks, flints, powder, ball, and articles of the greatest use. To these were added, fourteen bales and one box of Indian presents, distributed in the same manner, and composed of richly laced coats and other articles of dress, medals, flags, knives, and tomahawks for the chiefs—ornaments of different kinds, particularly beads, looking-glasses, handkerchiefs, paints, and generally such articles as were deemed best calculated for the taste of the Indians. The party was to embark on board of three boats; the first was a keel boat fifty-five feet long, drawing three feet water, carrying one large square sail and twenty-two oars, a deck of ten feet in the bow and stern formed a fore-castle and cabin, while the middle was covered by lockers, which might be raised so as to form a breast-work in case of attack. This was accompanied by two perioques or open boats, one of six and the other of seven oars. Two horses were at the same time to be led along the banks of the river for the pur-

pose of bringing home game, or hunting in case of scarcity.

Of the proceedings of this expedition, the following is a succinct and circumstantial narrative.

All the preparations being completed, we left our encampment on Monday, May 14th, 1804. This spot is at the mouth of the Wood river, a small stream which empties itself into the Mississippi, opposite to the entrance of the Missouri. It is situated in latitude $38^{\circ} 55' 19\frac{6}{10}''$ north, and longitude from Greenwich, $89^{\circ} 57' 45''$. On both sides of the Mississippi the land for two or three miles is rich and level, but gradually swells into a high pleasant country, with less timber on the western than on the eastern side, but all susceptible of cultivation. The point which separates the two rivers on the north, extends for fifteen or twenty miles, the greater part of which is an open level plain, in which the people of the neighbourhood cultivate what little grain they raise. Not being able to set sail before four o'clock P. M., we did not make more than four miles, and encamped on the first island opposite a small creek called Cold Water.

May 15. The rain, which had continued yesterday and last night, ceased this morning. We then proceeded, and after passing two small islands about ten miles further, stopped for the night at Piper's landing, opposite another island. The water is here very rapid and the banks falling in. We found that our boat was too heavily laden in the stern, in consequence of which she ran on logs

three times to-day. It became necessary to throw the greatest weight on the bow of the boat, a precaution very necessary in ascending both the Missouri and Mississippi rivers, in the beds of which there lie great quantities of concealed timber.

The next morning we set sail at five o'clock. At the distance of a few miles, we passed a remarkable large coal hill on the north side, called by the French *La Charbonniere*, and arrived at the town of St. Charles. Here we remained a few days.

St. Charles is a small town on the north bank of the Missouri, about twenty-one miles from its confluence with the Mississippi. It is situated in a narrow plain, sufficiently high to protect it from the annual risings of the river in the month of June, and at the foot of a range of small hills, which have occasioned its being called *Petite Côté*, a name by which it is more known to the French than by that of St. Charles. One principal street, about a mile in length and running parallel with the river, divides the town, which is composed of nearly one hundred small wooden houses, besides a chapel. The inhabitants, about four hundred and fifty in number, are chiefly descendants from the French of Canada; and, in their manners, they unite all the careless gaiety, and the amiable hospitality of the best times of France: yet, like most of their countrymen in America, they are but ill qualified for the rude life of a frontier: not that they are without

talent, for they possess much natural genius and vivacity; nor that they are destitute of enterprize, for their hunting excursions are long, laborious, and hazardous: but their exertions are all desultory; their industry is without system, and without perseverance. The surrounding country, therefore, though rich, is not, in general, well cultivated; the inhabitants chiefly subsisting by hunting and trade with the Indians, and confine their culture to gardening, in which they excel.

Being joined by Captain Lewis, who had been detained by business at St. Louis, we again set sail on Monday, May 21st, in the afternoon, but were prevented by wind and rain from going more than about three miles, when we encamped on the upper point of an island, nearly opposite a creek, which falls in on the south side.

On the 22d we made about eighteen miles, passing several small farms on the bank of the river, a number of islands, and a large creek on the south side, called Bonhomme, or Goodman's river. A small number of emigrants from the United States have settled on the sides of this creek, which are very fertile. We also passed some high lands, and encamped, on the north side, near a small creek. Here we met with a camp of Kickapoo Indians who had left us at St. Charles, with a promise of procuring us some provisions by the time we overtook them. They now made us a present of four deer, and we gave them in return two quarts of whiskey.

This tribe reside on the heads of the Kaskaskia and Illinois river, on the other side of the Mississippi, but occasionally hunt on the Missouri.

May 23. Two miles from our camp of last night, we reached a river emptying itself on the north side, called Osage Woman river. It is about thirty yards wide, and has now a settlement of thirty or forty families from the United States. About a mile and a half beyond this is a large cave, on the south side at the foot of cliffs, nearly three hundred feet high, overhanging the water, which becomes very swift at this place. The cave is one hundred and twenty feet wide, forty feet deep, and twenty high; it is known by the name of the Tavern among the traders, who have written their names on the rock, and painted some images which command the homage of the Indians and French. About a mile further we passed a small creek called Tavern creek, and encamped on the south side of the river, having gone nine miles.

Early the next morning we ascended a very difficult rapid, called the Devil's Race Ground, where the current sets for half a mile against some projecting rocks on the south side. We were less fortunate in attempting a second place of equal difficulty. Passing near the southern shore, the bank fell in so fast as to oblige us to cross the river instantly, between the northern side and a sandbar, which is constantly moving and banking with the violence of the current. The boat struck on it, and would have upset immediately, if the

men had not jumped into the water and held her, till the sand washed from under her. We encamped on the south side, having ascended ten miles; and the next day, May 25, passed on the south side the mouth of Wood river, on the north, two small creeks and several islands, and stopped for the night at the entrance of a creek on the north side, called by the French *La Charette*, ten miles from our last encampment, and a little above a small village of the same name. It consists of seven small houses, and as many poor families who have fixed themselves here for the convenience of trade, and form the last establishment of whites on the Missouri. It rained last night, yet we found this morning that the river had fallen several inches.

May 26. The wind being favourable we made eighteen miles to-day. We passed in the morning several islands, the largest of which is *Buffaloe island*, separated from the southern side by a small channel which receives the waters of *Buffaloe creek*. On the same side is *Shepherd's creek*, a little beyond which, we encamped on the northern side. The next day we sailed along a large island called *Otter island*, on the northern side, extending nearly ten miles in length, narrow, but high in its situation, and one of the most fertile in the whole river. Between it and the northern shore, three small creeks, one of which has the same name with the island, empty themselves. On the southern shore is a creek twenty yards wide, called *Ash creek*. In the course of the day we met two

canoes loaded with furs, which had been two months on their route from the *Mahar nation*, residing more than seven hundred miles up the river — one large raft from the *Pawnees* on the river *Platte*, and three others from the *Grand Osage* river. At the distance of fifteen miles we encamped on a willow island, at the entrance of the river *Gasconade*. This river falls into the *Missouri* from the south, one hundred miles from the *Mississippi*. Its length is about one hundred and fifty miles in a course generally north-east through a hilly country. On its banks are a number of salt-petre caves, and it is believed some mines of lead in the vicinity. Its width at the mouth is one hundred and fifty-seven yards, and its depth nineteen feet.

Here we halted for the purpose of hunting and drying our provisions, and making the necessary celestial observations. This being completed, we set sail on the 29th at four o'clock, and at four miles distance encamped on the south side, above a small creek, called *Deer creek*. The next day, 30th, we set out early, and at two miles distant reached a large cave, on the north, called *Montbrun's tavern*, after a French trader of that name, just above a creek called after the same person. Beyond this is a large island, and at the distance of four miles, *Rush creek* coming in from the south, at eleven, *Big-muddy river* on the north, about fifty yards wide; three miles further, is *Little-muddy river* on the same side, opposite to which

we encamped at the mouth of Grindstone creek. The rain which began last night continued through the day, accompanied with high wind and some hail. The river has been rising fast for two days, and the country around appears full of water. Along the sides of the river to day we observe much timber, the cotton wood, the sycamore, hickory, white walnut, some grapevines, and rushes — the high west wind and rain compelled us to remain all the next day, May 31. In the afternoon a boat came down from the Grand Osage river, bringing a letter from a person sent to the Osage nation on the Arkansaw river, which mentioned that the letter announcing the cession of Louisiana was committed to the flames — that the Indians would not believe that the Americans were owners of that country, and disregarded St. Louis and its supplies. The party was occupied in hunting, in the course of which they caught in the woods several very large rats. We set sail early the next morning, June 1st, and at six miles distant passed Bear creek, a stream of about twenty-five yards width: but the wind being a-head, and the current rapid, we were unable to make more than thirteen miles to the mouth of the Osage river; where we encamped and remained the following day, for the purpose of making celestial observations. The Osage river empties itself into the Missouri, at one hundred and thirty-three miles distance from the mouth of the latter river. Its general course is west and west-south-west, through a rich and level country. At

the junction the Missouri is about eight hundred and seventy-five yards wide, and the Osage three hundred and ninety-seven. The low point of junction is in latitude $38^{\circ} 31' 16''$, and at a short distance from it is a high commanding position, whence we enjoyed a delightful prospect of the country.

The Osage river gives or owes its name to a nation inhabiting its banks at a considerable distance from this place. Their present name however, seems to have originated from the French traders, for both among themselves and their neighbours, they are called the Wasbashes. Their number is between twelve and thirteen hundred warriors, and consist of three tribes: the Great Osages of about five hundred warriors, living in a village on the south bank of the river — the Little Osages, of nearly half that number, residing at the distance of six miles from them — and the Arkansaw band, a colony of Osages, of six hundred warriors, who left them some years ago, under the command of a chief called the Bigfoot, and settled on the Vermillion river, a branch of the Arkansaw. In person the Osages are among the largest and best formed Indians, and are said to possess fine military capacities; but residing as they do in villages, and having made considerable advance in agriculture, they seem less addicted to war than their northern neighbours, to whom the use of rifles gives a great superiority. Among the peculiarities of this people, there is nothing more remarkable than the

tradition relative to their origin. According to universal belief, the founder of the nation was a snail, passing a quiet existence along the banks of the Osage, till a high flood swept him down to the Missouri, and left him exposed on the shore. The heat of the sun at length ripened him into a man, but with the change of his nature, he had not forgotten his native seats on the Osage, towards which, he immediately bent his way. He was however, soon overtaken by hunger and fatigue, when happily the Great Spirit appeared, and giving him a bow and arrow, showed him how to kill and cook deer, and cover himself with the skin. He then proceeded to his original residence, but as he approached the river, he was met by a beaver, who inquired haughtily who he was, and by what authority he came to disturb his possession. The Osage answered that the river was his own, for he had once lived on its borders. As they stood disputing, the daughter of the beaver came, and having by her entreaties reconciled her father to this young stranger, it was proposed that the Osage should marry the young beaver, and share with her family the enjoyment of the river. The Osage readily consented, and from this happy union there soon came the village and the nation of the Wasbasha, or Osages, who have ever since preserved a pious reverence for their ancestors, abstaining from the chase of the beaver, because in killing that animal, they killed a brother of the Osage. Of late years, however, since the trade with the

whites has rendered beaver-skins more valuable, the sanctity of these maternal relatives has visibly diminished, and the poor animals have nearly lost all the privileges of kindred.

On the afternoon of June 3, we proceeded, and at three miles distance, reached a creek called Cupboard creek, from a rock of that appearance near its entrance. Two miles further we encamped at Moreau creek, a stream of twenty yards width, on the southern side. The next morning, we passed at an early hour, Cedar island on the north, so called from the abundance of the tree of that name; near which is a small creek, named Nightingale creek, from a bird of that species, who sang for us during the night. Beyond Cedar island, are some others of a smaller extent, and at seven miles distance a creek fifteen or twenty yards wide, entering from the north, and known by the name of Cedar creek. At seven and a half miles further, we passed on the south side another creek, which we called Mast creek, from the circumstance of our mast being broken by running under a concealed tree; a little above is another creek on the left, one mile beyond which we encamped on the southern shore under high projecting cliffs. The French had reported that lead ore was to be found in this place, but on examining the hills, we could discern no appearance of that mineral. Along the river on the south, is a low land covered with rushes, and high nettles, and near the mouths of the creeks, supplied with oak, ash, and walnut timber. On

the north the land is rich and well situated. We made seventeen and a half miles this day. The river is falling slowly. We continued our route the next morning early: a small creek called Lead creek, on the south; another on the north, known to the French by the name of Little Good Woman's creek, and again Big Rock creek on the south were the only streams we passed this morning. At eleven o'clock we met a raft made of two canoes joined together, in which two French traders were descending, from eighty leagues up the river Kansas, where they had wintered, and caught great quantities of beaver, but had lost much of their game by fires from the prairies. They told us that the Kansas nation is now hunting buffaloe in the plains, having passed the last winter in this river. Two miles further, we reached on the south Little Manitou creek, which takes its name from a strange figure resembling the bust of a man, with the horns of a stag, painted on a projecting rock, which may represent some spirit or deity. Near this is a sandbar extending several miles, which renders the navigation difficult, and a small creek called Sand creek on the south, where we stopped for dinner, and gathered wild cresses and tongue grass from the sandbar. The rapidity of the currents, added to our having broken our mast, prevented our going more than twelve and a half miles. The scouts and hunters whom we always kept out, report that they have seen fresh tracks of Indians. The next morning we left our camp, which was on the south

side, opposite to a large island in the middle of the river, and at five miles reached a creek, on the north side, of about twenty yards wide, called Split Rock creek, from a fissure in the point of a neighbouring rock. Three miles beyond this, on the south, is Saline river; it is about thirty yards wide, and has its name from the number of salt licks and springs, which render its water brackish; the river is very rapid, and the banks are falling in. After leaving Saline creek, we passed one large island and several smaller ones, having made fourteen miles. The water rose a foot during the last night.

The next day, June 7, we passed at four and a half miles Big Manitou creek, near which is a limestone rock inlaid with flint of various colours, and embellished, or at least covered, with uncouth paintings of animals and inscriptions. We landed to examine it, but found the place occupied by a nest of rattlesnakes, of which we killed three. We also examined some licks and springs of salt water, two or three miles up this creek. We then proceeded by some small willow islands, and encamped at the mouth of Good Woman river on the north. It is about thirty-five yards wide, and said to be navigable for boats several leagues. The hunters, who had hitherto given us only deer, brought in this evening three bears, and had seen some indication of buffaloe. We had come fourteen miles.

June 8, we saw several small willow islands, and a creek on the south, near which are a number of deer licks; at nine miles distance we came to Mine

river. This river, which falls into the Missouri from the south, is said to be navigable for boats eighty or ninety miles, and is about seventy yards wide at its mouth. It forks about five or six leagues from the Missouri, and at the point of junction are some very rich salt springs; the west branch in particular, is so much impregnated, that, for twenty miles, the water is not palatable: several branches of the Manitou and Good Woman are equally affected. The French report also, that lead ore has been found on different parts of the river. We made several excursions near the river through the low rich country on its banks, and after dinner went on to the island of Mills, where we encamped. We met with a party of three hunters from the Sioux river; they had been out for twelve months, and collected about nine hundred dollars worth of peltries and furs. We ascended this river twelve miles.

On the 9th, we set out early, and reached a cliff of rocks, called the Arrow Rock, near to which is a prairie called the Prairies of Arrows, and Arrow creek, a small stream about eight yards wide, whose source is in the adjoining prairies on the south. At this cliff the Missouri is confined within a bed of two hundred yards; about four miles to the south east is a large lick and salt spring of great strength. About three miles further is Blackbird creek on the north side, opposite to which, is an island and a prairie enclosing a small lake. Five miles beyond this we encamped on the south side, after making,

in the course of the day, thirteen miles. The land on the north is a high rich plain. On the south it is also even, of a good quality, and rising from fifty to one hundred feet.

On the next morning, 10th, we passed Deer creek, and at the distance of five miles, the two rivers called by the French the two Charatons, a corruption of Thieraton; the first of these is thirty, the second seventy yards wide, and they enter the Missouri together. They are both navigable for boats: the country through which they pass is broken, rich, and thickly covered with timber. The Ayauway nation, consisting of three hundred men, have a village near its head-waters on the river Des Moines. Farther on we passed a large island called *Chicot* or Stump Island, and encamped on the south, after making ten miles. A head wind forced us to remain there all the next day, during which we dried the meat we had killed, and examined the surrounding country, which consists of good land, well watered, and supplied with timber: the prairies also differ from those eastward of the Mississippi, inasmuch as the latter are generally without any covering except grass, whilst the former abound with hazel, grapes and other fruits, among which is the Osage plum of a superior size and quality.

On the morning of the 12th, we passed through difficult places in the river, and reached Plum creek on the south side. At one o'clock, we met two rafts loaded, the one with furs, the other with

the tallow of buffaloe; they were from the Sioux nation, and on their way to St. Louis; but we were fortunate enough to engage one of the party, a Mr. Durion, who had lived with that nation more than twenty years, and was high in their confidence, to accompany us thither. We made nine miles. On the 13th, we passed at between four and five miles, a bend of the river, and two creeks on the north, called the Round Bend creeks. Between these two creeks is the prairie, in which once stood the ancient village of the Missouris. Of this village there remains no vestige, nor is there any thing to recall this great and numerous nation, except a feeble remnant of about thirty families. They were driven from their original seats by the invasions of the Sauks and other Indians from the Mississippi, who destroyed at this village two hundred of them in one contest; the rest sought refuge near the Little Osage, on the other side of the river. The encroachment of the same enemies forced, about thirty years since, both these nations from the banks of the Missouri. A few retired with the Osage, and the remainder found an asylum on the river Platte, among the Ottoes, who are themselves declining. Opposite the plain there was an island and a French fort, but there is now no appearance of either, the successive inundations having probably washed them away, as the willow island which is in the situation described by Du Pratz, is small and of recent formation. Five miles from this place is the mouth of Grand River, where

we encamped. This river follows a course nearly south, or south east, and is between eighty and a hundred yards wide where it enters the Missouri, near a delightful and rich plain. A racoon, a bear, and some deer were obtained to-day. We proceeded at six o'clock the next morning. The current was so rapid and the banks on the north falling in so constantly, that we were obliged to approach the sandbars on the south. These were moving continually, and formed the worst passage we had seen, and which we surmounted with much difficulty. We met a trading raft from the Pawnee nation on the river Platte, and attempted unsuccessfully to engage one of their party to return with us. At the distance of eight miles, we came to some high cliffs, called the Snake bluffs, from the number of that animal in the neighbourhood, and immediately above these bluffs, Snake creek, about eighteen yards wide, on which we encamped. One of our hunters, a half Indian, brought us an account of his having to-day passed a small lake, near which a number of deer were feeding, and in the pond he heard a snake making a guttural noise like a turkey. He fired his gun, but the noise became louder. He adds, that he has heard the Indians mention this species of snake, and this story is confirmed by a Frenchman of our party.

All the next day, the river being very high, the sandbars were so rolling and numerous, and the current so strong, that we were unable to stem it even with oars added to our sails; this obliged

us to go nearer the banks, which were falling in, so that we could not make, though the boat was occasionally towed, more than fourteen miles. We passed several islands and one creek on the south side, and encamped on the north opposite a beautiful plain, which extends as far back as the Osage river, and some miles up the Missouri. In front of our encampment are the remains of an old village of the Little Osage, situated at some distance from the river, and at the foot of a small hill. About three miles above them, in view of our camp is the situation of the old village of the Missouris after they fled from the Sauks. The inroads of the same tribe compelled the Little Osage to retire from the Missouri a few years ago, and establish themselves near the Great Osages. The river which is here about one mile wide, had risen in the morning, but fell towards the evening. Early this morning, June 16th, we joined the camp of our hunters, who had provided two deer and two bears, and then passing an island and a prairie on the north covered with a species of timothy, made our way through bad sandbars and a swift current, to an encampment for the evening, on the north side, at ten miles distant. The timber which we examined to-day was not sufficiently strong for oars; the mosquitoes and ticks are exceedingly troublesome. On the 17th, we set out early, and having come to a convenient place at one mile distance, for procuring timber and making oars, we occupied ourselves in that way on this and the following day.

The country on the north of the river is rich and covered with timber; among which we procured the ash for oars. At two miles it changes into extensive prairies, and at seven or eight miles distance becomes higher and waving. The prairie and high lands on the south commence more immediately on the river; the whole is well watered and provided with game, such as deer, elk, and bear. The hunters brought in a fat horse which was probably lost by some war party — this being the crossing place for the Sauks, Ayaуways, and Sioux, in their excursions against the Osage.

June 19, the oars being finished, we proceeded under a gentle breeze by two large and some smaller islands. The sandbars are numerous and so bad, that at one place we were forced to clear away the driftwood in order to pass: the water was so rapid that we were under the necessity of towing the boat for half a mile round a point of rocks on the south side. We passed two creeks, one called Tiger creek on the north, twenty-five yards wide at the extremity of a large island called Panther Island: the other Tabo creek on the south, fifteen yards wide. Along the shores are gooseberries and raspberries in great abundance. At the distance of seventeen and a half miles we encamped on the south, near a lake about two miles from the river, and several in circumference; and much frequented by deer and all kinds of fowls. On the north the land is higher and better calculated for farms than that on the south, which ascends more gradually, but

is still rich and pleasant. The mosquitoes and other animals are so troublesome that mosquito biers or nets were distributed to the party. The next morning we passed a large island, opposite to which on the north is a large and beautiful prairie, called Sauk prairie, the land being fine and well timbered on both sides the river. Pelicans were seen to day. We made six and three quarter miles, and encamped at the lower point of a small island, along the north side of which we proceeded the next day, June 21st, but not without danger in consequence of the sands and the rapidity of the water which rose three inches last night. Behind another island come in from the south two creeks, called Eau Beau, or Clear Water creeks: on the north is a very remarkable bend, where the high lands approach the river, and form an acute angle at the head of a large island produced by a narrow channel through the point of the bend. We passed several other islands, and encamped at seven and a half miles on the south.

22d. The river rose during the night four inches. The water is very rapid and crowded with concealed timber. We passed two large islands and an extensive prairie on the south, beginning with a rich low land, and rising to the distance of seventy or eighty feet of rolling clear country. The thermometer at three o'clock P.M. was at 87°. After coming ten and a half miles we encamped on the south, opposite a large creek called Fire Prairie river.

23d. The wind was against us this morning, and became so violent that we made only three and a half miles, and were obliged to lie to during the day at a small island. This is separated from the northern side by a narrow channel which cannot be passed by boats, being choked with trees and drifted wood. Directly opposite on the south, is a high commanding position, more than seventy feet above high water mark, and overlooking the river, which is here of but little width; this spot has many advantages for a fort, and trading house with the Indians*. The river fell eight inches last night.

The next day, 24th, we passed at eight miles distance, Hay Cabin creek coming in from the south, about twenty yards wide, and so called from camps of straw built on it; to the north are some rocks projecting into the river, and a little beyond them a creek on the same side, called Charaton Scarty: that is, Charaton like the Otter. We halted, after having made eleven and a half miles, the country on both sides being fine and interspersed with prairies, in which we now see numerous herds of deer, pasturing in the plains or feeding on the young willows of the river.

* The United States built in September, 1808, a fort at this spot, which is very convenient for trading with the Osages, Ayauways, and Kansas.

25th. A thick fog detained us till eight o'clock, when we set sail, and at three miles reached a bank of stone coal on the north, which appeared to be very abundant: just below it is a creek called after the bank La Charbonniere. Four miles further, and on the southern side, comes in a small creek, called La Benite. The prairies here approach the river and contain many fruits, such as plums, raspberries, wild apples, and nearer the river vast quantities of mulberries. Our encampment was thirteen miles distance on an island to the north, opposite some hills higher than usual, and almost one hundred and sixty, or one hundred and eighty feet. 26th. At one mile we passed at the end of a small island, Blue Water creek, which is about thirty yards wide at its entrance from the south*. Here the Missouri is confined within a narrow bed, and the current still more so by counter-currents or whirls on one side, and a high bank on the other. We passed a small island and a sand bar, where our tow rope broke twice, and we rowed round with great exertions. We saw a number of paroquets, and killed some deer; after nine and three quarter miles, we encamped at the upper point of the mouth of the river Kansas: here we remained two days, during which we made the necessary observations, recruited the party, and repaired the boat.

* A few miles up the Blue Water Creek are quarries of Plaster of Paris, since worked and brought down to St. Louis.

The river Kansas takes its rise in the plains between the Arkansaw and Platte rivers, and pursues a course generally east till its junction with the Missouri, which is in latitude $38^{\circ} 31' 13''$; here it is three hundred and forty and a quarter yards wide, though it is wider a short distance above the mouth. The Missouri itself is about five hundred yards in width; the point of union is low and subject to inundations for two hundred and fifty yards, it then rises a little above high water mark, and continues so as far back as the hills. On the south of the Kansas the hills or highlands come within one mile and a half of the river; on the north of the Missouri they do not approach nearer than several miles; but on all sides the country is fine. The comparative specific gravities of the two rivers is, for the Missouri, seventy-eight, the Kansas seventy-two degrees; the waters of the latter have a very disagreeable taste; the former has risen during yesterday and to-day, about two feet. On the banks of the Kansas reside the Indians of the same name, consisting of two villages, one at about twenty, the other forty leagues from its mouth, and amounting to about three hundred men. They once lived twenty-four leagues higher than the Kansas, on the south bank of the Missouri, and were then more numerous, but they have been reduced and banished by the Sauks and Ayauways, who being better supplied with arms have an advantage over the Kansas, though the latter are not less fierce or warlike than themselves. This nation

is now hunting in the plains for the buffaloe, which our hunters have seen for the first time.

On the 29th, we set out late in the afternoon, and having passed a sandbar, near which the boat was almost lost, and a large island on the north, we encamped at seven and a quarter miles on the same side in the low lands, where the rushes are so thick that it is troublesome to walk through them. Early the next morning, 30th, we reached, at five miles distance, the mouth of a river coming in from the north, and called by the French, *Petite Riviere Platte*, or Little Shallow river; it is about sixty yards wide at its mouth. A few of the party who ascended informed us, that the lands on both sides are good, and that there are several falls well calculated for mills; the wind was, from the south-west, and the weather oppressively warm, the thermometer standing at 96° above 0 at three o'clock P.M. One mile beyond this is a small creek on the south, at five miles from which we encamped on the same side, opposite the lower point of an island called Diamond island. The land on the north between the Little Shallow river and the Missouri is not good, and subject to overflow — on the south it is higher and better timbered.

July 1st. We proceeded along the north side of Diamond island, where a small creek called Biscuit creek empties itself. One and a half mile above the island is a large sandbar in the middle of the river, beyond which we stopped to refresh the

men, who suffered very much from the heat. Here we observed great quantities of grapes and raspberries. Between one and two miles further are three islands and a creek on the south, known by the French name of *Remore*. The main current which is now on the south side of the largest of the three islands, ran three years, as we were told, on the north, and there was then no appearance of the two smaller islands. At the distance of four and a half miles, we reached the lower point of a cluster of small islands, two large and two small, called *Isles des Parcs* or Field Islands. *Paccaun* trees were this day seen, and large quantities of deer and turkies on the banks. We had advanced twelve miles.

July 2d. We left our encampment, opposite to which is a high and beautiful prairie on the southern side, and passed up the south of the islands, which are high meadows, and a creek on the north called *Parc creek*. Here for half an hour the river became covered with drift-wood, which rendered the navigation dangerous, and was probably caused by the giving way of some sandbar, which had detained the wood. After making five miles we passed a stream on the south, called *Turkey creek*, near a sandbar, where we could scarcely stem the current with twenty oars, and all the poles we had. On the north, at about two miles further, is a large island called by the Indians, *Wau-car-da-war-card-da*, or the Bear Medicine island. Here we landed and replaced our mast, which had been

broken three days ago, by running against a tree, overhanging the river. Thence we proceeded, and after night stopped on the north side, above the island, having come eleven and a half miles. Opposite our camp is a valley, in which was situated an old village of the Kansas, between two high points of land, and on the bank of the river. About a mile in the rear of the village was a small fort, built by the French on an elevation. There are now no traces of the village, but the situation of the fort may be recognized by some remains of chimnies, and the general outline of the fortification, as well as by the fine spring which supplied it with water. The party who were stationed here, were probably cut off by the Indians, as there are no accounts of them.

July 3d. A gentle breeze from the south carried us eleven and a quarter miles this day; past two islands, one a small willow island, the other large, and called by the French, *Isle des Vaches*, or *Cow island*. At the head of this island, on the northern shore, is a large pond containing beaver, and fowls of different kinds. After passing a bad sandbar, we stopped on the south side at an old trading house, which is now deserted, and half a mile beyond it encamped on the south. The land is fine along the rivers, and some distance back. We observed the black walnut and oak, among the timber; and the honey-suckle, and the buck's eye, with the nuts on them.

The morning of the 4th July was announced

by the discharge of our gun. At one mile we reached the mouth of a bayeau or creek, coming from a large lake on the north side, which appears as if it had once been the bed of the river, to which it runs parallel for several miles. The water of it is clear, and supplied by a small creek and several springs, and the number of goslings which we saw on it, induced us to call it the Goslin lake. It is about three quarters of a mile wide, and seven or eight miles long. One of our men was bitten by a snake, but a poultice of bark and gunpowder was sufficient to cure the wound. At ten and a quarter miles we reached a creek on the south, about twelve yards wide, and coming from an extensive prairie, which approached the borders of the river. To this creek, which had no name, we gave that of Fourth of July creek; above it is a high mound, where three Indian paths centre, and from which is a very extensive prospect. After fifteen miles sail we came to on the north, a little above a creek on the southern side, about thirty yards wide, which we called Independence creek, in honour of the day, which we could celebrate only by an evening gun, and an additional gill of whiskey to the men.

The next day, 5th, we crossed over to the south, and came along the bank of an extensive and beautiful prairie, interspersed with copses of timber, and watered by Independence creek. On this bank formerly stood the second village of the Kansas; from the remains it must have been once a

large town. We passed several bad sandbars, and a small creek to the south, which we called Yellow Ochre creek, from a bank of that mineral a little above it. The river continues to fall. On the shores are great quantities of summer and fall grapes, berries, and wild roses. Deer is not so abundant as usual, but there are numerous tracks of elk around us. We encamped at ten miles distance on the south side, under a high bank, opposite to which was a low land covered with tall rushes, and some timber.

July 6. We set sail, and at one mile passed a sandbar, three miles further an island, a prairie to the north, at the distance of four miles called Reevey's prairie, after a man who was killed there; at which place the river is confined to a very narrow channel, and by a sandbar from the south. Four miles beyond is another sandbar, terminated by a small willow island, and forming a very considerable bend in the river towards the north. The sand of the bar is light, intermixed with small pebbles and some pit coal. The river falls slowly, and, owing either to the muddiness of its water, or the extreme heat of the weather, the men perspire profusely. We encamped on the south, having made twelve miles. The bird called whip-poor-will sat on the boat for some time.

In the morning, July 7th, the rapidity of the water obliged us to draw the boat along with ropes. At six and three quarter miles, we came to a sandbar, at a point opposite a fine rich prairie

on the north, called St. Michael's. The prairies of this neighbourhood have the appearance of distinct farms, divided by narrow strips of woodland, which follow the borders of the small runs leading to the river. Above this, about a mile, is a cliff of yellow clay on the north. At four o'clock we passed a narrow part of the channel, where the water is confined within a bed of two hundred yards wide, the current running directly against the southern bank, with no sand on the north to confine it or break its force. We made fourteen miles, and halted on the north, after which we had a violent gust about seven o'clock. One of the hunters saw in a pond to the north, which we passed yesterday, a number of young swans. We saw a large rat, and killed a wolf. Another of our men had a stroke of the sun; he was bled, and took a preparation of nitre, which relieved him considerably.

July 8. We set out early, and soon passed a small creek on the north, which we called Ordway's creek, from our sergeant of that name, who had been sent on shore with the horses, and went up it. On the same side are three small islands, one of which is the Little Nodawa, and a large island called the Great Nodawa, extending more than five miles, and containing seven or eight thousand acres of high good land, rarely overflowed, and one of the largest islands of the Missouri. It is separated from the northern shore by a small channel of from forty-five to eighty yards

wide, up which we passed, and found near the western extremity of the island, the mouth of the river Nodawa. This river pursues nearly a southern course, is navigable for boats to some distance, and about seventy yards wide above the mouth, though not so wide immediately there, as the mud from the Missouri contracts its channel. At twelve and a quarter miles, we encamped on the north side, near the head of Nodawa island, and opposite a smaller one in the middle of the river. Five of the men were this day sick with violent headaches. The river continues to fall.

July 9th. We passed the island opposite to which we last night encamped, and saw near the head of it a creek falling in from a pond on the north, to which we gave the name of Pike pond, from the numbers of that animal which some of our party saw from the shore. The wind changed at eight from N.E. to S.W. and brought rain. At six miles we passed the mouth of Monser's creek on the south, and two miles above a few cabins, where one of our party had encamped with some Frenchmen about two years ago. Further on we passed an island on the north, opposite some cliffs on the south side, near which Loup or Wolf river falls into the Missouri. This river is about sixty yards wide, it heads near the same sources as the Kansas, and is navigable for boats, at some distance up. At fourteen miles we encamped on the south side.

Tuesday 10th. We proceeded on by a prairie on the upper side of Wolf river, and at four miles

passed a creek fifteen yards wide on the south, called Pape's creek, after a Spaniard of that name, who killed himself there. At six miles we dined on an island called by the French Ile de Salomon, or Solomon's Island, opposite to which, on the south, is a beautiful plain covered with grass, intermixed with wild rye and a kind of wild potatoe. After making ten miles we stopped for the night on the northern side, opposite a cliff of yellow clay. The river has neither risen nor fallen to day. On the north the low land is very extensive, and covered with vines; on the south, the hills approach nearer the river, and back of them commence the plains. There are a great many goslings along the banks.

Wednesday 11th. After three miles sailing we came to a willow island on the north side, behind which enters a creek, called by the Indians Tarkio. Above this creek, on the north, the low lands are subject to overflow, and further back the undergrowth of vines particularly, is so abundant that they can scarcely be passed. Three miles from the Tarkio we encamped on a large sand island on the north, immediately opposite the river Nemahaw.

Thursday 12th. We remained here to day for the purpose of refreshing the party, and making lunar observations. The Nemahaw empties itself into the Missouri from the south, and is eighty yards wide at the confluence, which is in lat. $39^{\circ} 55' 56''$: Captain Clarke ascended it in the perioque about two miles to the mouth of a small creek on the lower side. On going ashore he found

in the level plain several artificial mounds or graves, and on the adjoining hills others of a larger size. This appearance indicates sufficiently the former population of this country, the mounds being certainly intended as tombs; the Indians of the Missouri still preserving the custom of interring the dead on high ground. From the top of the highest mound a delightful prospect presented itself—the level and extensive meadows watered by the Nemahaw, and enlivened by the few trees and shrubs skirting the borders of the river and its tributary streams—the low land of the Missouri covered with undulating grass, nearly five feet high, gradually rising into a second plain, where rich weeds and flowers are interspersed with copses of the Osage plum; further back are seen small groves of trees; an abundance of grapes; the wild cherry of the Missouri, resembling our own, but larger, and growing on a small bush; and the choke cherry, which we observed for the first time. Some of the grapes gathered to-day are nearly ripe. On the south of the Nemahaw, and about a quarter of a mile from its mouth, is a cliff of freestone, in which are various inscriptions and marks made by the Indians. The sand island where we are encamped, is covered with the two species of willow, broad and narrow leaf.

July 13th. We proceeded at sunrise with a fair wind from the south, and at two miles, passed the mouth of a small river on the north, called Big Tarkio. A channel from the bed of the Missouri

once ran into this river, and formed an island called St. Joseph's, but the channel is now filled up, and the island is added to the northern shore. Further on to the south, is situated an extensive plain, covered with a grass resembling timothy in its general appearance, except the seed, which is like flaxseed, and also a number of grape-vines. At twelve miles, we passed an island on the north, above which is a large sandbar covered with willows: and at twenty and a half miles, stopped on a large sandbar, in the middle of the river, opposite a high handsome prairie, which extends to the hills four or five miles distant, though near the bank the land is low, and subject to be overflowed. This day was exceedingly fine and pleasant, a storm of wind and rain from north-northeast, last night, having cooled the air.

July 14. We had some hard showers of rain before seven o'clock, when we set out. We had just reached the end of the sand island, and seen the opposite banks falling in, and so lined with timber that we could not approach it without danger, when a sudden squall from the north-east, struck the boat on the starboard quarter, and would have certainly dashed her to pieces on the sand island, if the party had not leaped into the river, and with the aid of the anchor and cable kept her off: the waves dashing over her for the space of forty minutes; after which, the river became almost instantaneously calm and smooth. The two perioues were a-head, in a situation nearly similar,

but fortunately no damage was done to the boats or the loading. The wind having shifted to the south-east, we came at the distance of two miles, to an island on the north, where we dined. One mile above, on the same side of the river, is a small factory, where a merchant of St. Louis traded with the Ottoes and Pawnees two years ago. Near this is an extensive lowland, part of which is overflowed occasionally, the rest is rich and well timbered. The wind again changed to north-west by north. At seven and a half miles, we reached the lower point of a large island, on the north side. A small distance above this point, is a river, called by the Maha Indians, Nishnahbatona. This is a considerable creek, nearly as large as the Mine river, and runs parallel to the Missouri the greater part of its course, being fifty yards wide at the mouth. In the prairies or glades, we saw wild-timothy, lambs-quarter, cuckieberries, and on the edges of the river, summer-grapes, plums, and gooseberries. We also saw to-day, for the first time, some elk, at which some of the party shot, but at too great a distance. We encamped on the north side of the island, a little above Nishnahbatona, having made nine miles. The river fell a little.

July 15. A thick fog prevented our leaving the encampment before seven. At about four miles, we reached the extremity of the large island, and crossing to the south, at the distance of seven miles, arrived at the little Nemaha, a small river from the south, forty yards wide a little above its

mouth, but contracting, as do almost all the waters emptying into the Missouri at its confluence. At nine and three quarters miles, we encamped on a woody point, on the south. Along the southern bank, is a rich lowland covered with peavine, and rich weeds, and watered by small streams rising in the adjoining prairies. They too, are rich, and though with abundance of grass, have no timber except what grows near the water: interspersed through both are grapevines, plums of two kinds, two species of wild cherries, hazlenuts, and gooseberries. On the south there is one unbroken plain; on the north the river is skirted with some timber, behind which the plain extends four or five miles to the hills, which seem to have little wood.

July 16. We continued our route between a large island opposite to our last night's encampment, and an extensive prairie on the south. About six miles, we came to another large island, called Fairsun island, on the same side; above which is a spot, where about twenty acres of the hill have fallen into the river. Near this is a cliff of sandstone for two miles, which is much frequented by birds. At this place the river is about one mile wide, but not deep; as the timber or sawyers may be seen scattered across the whole of its bottom. At twenty miles distance, we saw on the south, an island called by the French, l'Ile Chauve, or Bald island, opposite to a large prairie, which we called Bald-pated prairie, from a ridge of naked hills which bound it, running parallel with the river as

far as we could see, and from three to six miles distant. To the south the hills touch the river. We encamped a quarter of a mile beyond this, in a point of woods on the north side. The river continues to fall.

Tuesday, July 17. We remained here this day, in order to make observations and correct the chronometer, which ran down on Sunday. The latitude we found to be $40^{\circ} 27' 51\frac{4}{10}''$. The observation of the time proved our chronometer too slow by $6' 51\frac{6}{10}''$. The highlands bear from our camp, north 25° west, up the river. Captain Lewis rode up the country, and saw the Nishnahbatona, about ten or twelve miles from its mouth, at a place not more than three hundred yards from the Missouri, and a little above our camp. It then passes near the foot of the Baldhills, and is at least six feet below the level of the Missouri. On its bank are the oak, walnut, and mulberry. The common current of the Missouri, taken with the log, is 50 fathoms in 40'', at some places, and even 20''.

Wednesday, July 18. The morning was fair, and a gentle wind from southeast by south, carried us along between the prairie on the north, and Bald island to the south: opposite the middle of which, the Nishnahbatona approaches the nearest to the Missouri. The current here ran fifty fathoms in 41''.

At thirteen and a half miles, we reached an island on the north, near to which the banks overflow; while on the south, the hills project over the river and form high cliffs. At one point a part of the cliff, nearly three quarters of a mile in length, and

about two hundred feet in height, has fallen into the river. It is composed chiefly of sandstone intermixed with an iron ore of bad quality; near the bottom is a soft slatestone with pebbles. We passed several bad sandbars in the course of the day, and made eighteen miles, and encamped on the south, opposite to the lower point of the Oven islands. The country around is generally divided into prairies, with little timber, except on low points, islands, and near creeks, and that consisting of cottonwood, mulberry, elm, and sycamore. The river falls fast. An Indian dog came to the bank; he appeared to have been lost, and was nearly starved: we gave him some food, but he would not follow us.

Thursday, July 19. The Oven islands are small, and two in number; one near the south shore, the other in the middle of the river. Opposite to them is the prairie, called Terrien's Oven, from a trader of that name. At four and a half miles, we reached some high cliffs of a yellow earth, on the south, near which are two beautiful runs of water, rising in the adjacent prairies, and one of them with a deerlick, about two hundred yards from its mouth. In this neighbourhood we observed some iron ore in the bank. At two and a half miles above the runs, a large portion of the hill, for nearly three quarters of a mile, has fallen into the river. We encamped on the western extremity of an island, in the middle of the river, having made ten and three quarter miles. The river falls a little. The

The sandbars which we passed to-day, are more numerous, and the rolling sands more frequent and dangerous than any we have seen; these obstacles increasing as we approach the river Platte. The Missouri here is wider also than below, where the timber on the banks resists the current; while here the prairies which approach, are more easily washed and undermined. The hunters have brought for the last few days, no quadruped, but deer: great quantities of young geese are seen to-day; one of them brought calamus, which he had gathered opposite our encampment, and a large quantity of sweetflag.

Friday, July 20. There was a heavy dew last night, and this morning was foggy and cool. We passed at about three miles distance, a small willow island to the north, and a creek on the south, about twenty-five yards wide, called by the French *L'eau qui Pleure*, or the Weeping Water, and emptying itself just above a cliff of brown clay. Thence we made two and a half miles to another island; three miles further to a third: six miles beyond which is a fourth island; at the head of which we encamped on the southern shore; in all eighteen miles. The party who walked on the shore to-day, found the plains to the south, rich, but much parched with frequent fires, and with no timber, except the scattering trees about the sources of the runs, which are numerous and fine. On the north, is a similar prairie country. The river continues to fall. A large yellow wolf was this day killed.

For a month past the party had been troubled with biles, and occasionally with the dysentery. These biles were large tumours which broke out under the arms, on the legs, and, generally, in the parts most exposed to action, which sometimes became too painful to permit the men to work. After remaining some days, they disappeared without any assistance, except a poultice of the bark of the elm, or of Indian meal. This disorder, which we ascribe to the muddiness of the river water, has not affected the general health of the party, which is quite as good, if not better, than that of the same number of men in any other situation.

Saturday, July 21. We had a breeze from the south-east, by the aid of which we passed, at about ten miles, a willow island on the south, near high lands covered with timber, at the bank, and formed of limestone with cemented shells: on the opposite side is a bad sandbar, and the land near it is cut through at high water, by small channels forming a number of islands. The wind lulled at seven o'clock, and we reached, in the rain, the mouth of the great river Platte, at the distance of fourteen miles. The highlands which had accompanied us on the south, for the last eight or ten miles, stopped at about three quarters of a mile from the entrance of the Platte. Captains Lewis and Clarke ascended the river in a perioque, for about one mile, and found the current very rapid; rolling over sands, and divided into a number of channels; none of which are deeper than five or six feet.

One of our Frenchmen, who spent two winters on it, says that it spreads much more at some distance from the mouth; that its depth is generally not more than five or six feet; that there are many small islands scattered through it, and that from its rapidity and the quantity of its sand, it cannot be navigated by boats or perioques, though the Indians pass it in small flat canoes made of hides. That the Saline or Salt river, which in some seasons is too brackish to be drank, falls into it from the south about thirty miles up, and a little above it Elkhorn river from the north, running nearly parallel with the Missouri. The river is, in fact, much more rapid than the Missouri, the bed of which it fills with moving sands, and drives the current on the northern shore, on which it is constantly encroaching. At its junction the Platte is about six hundred yards wide, and the same number of miles from the Mississippi. With much difficulty we worked round the sandbars near the mouth, and came to above the point, having made fifteen miles. A number of wolves were seen and heard around us in the evening.

July 22. The next morning we set sail, and having found at the distance of ten miles from the Platte, a high and shaded situation on the north, we encamped there, intending to make the requisite observations, and to send for the neighbouring tribes, for the purpose of making known the recent change in the government, and the wish of the United States to cultivate their friendship.

CHAPTER II.

SOME ACCOUNT OF THE PAWNEE INDIANS — COUNCIL HELD WITH THE OTTO AND MISSOURI INDIANS — COUNCIL HELD WITH ANOTHER PARTY OF THE OTTOES — DEATH OF SERGEANT FLOYD — THE PARTY ENCAP NEAR THE MOUTH OF WHITESTONE RIVER — THE CHARACTER OF THE MISSOURI, WITH THE RIVERS THAT ENTER IT — THE SURROUNDING COUNTRY — THE VARIOUS ISLANDS, BAYS, CREEKS, &c. GIVEN IN THE COURSE OF THE EXPEDITION.

OUR camp is by observation in latitude $41^{\circ} 3' 11''$. Immediately behind it is a plain about five miles wide, one half covered with wood, the other dry and elevated. The low grounds on the south near the junction of the two rivers, are rich, but subject to be overflowed. Farther up, the banks are higher, and opposite our camp the first hills approach the river, and are covered with timber, such as oak, walnut, and elm. The intermediate country is watered by the Papillon, or Butterfly creek, of about eighteen yards wide, and three miles from the Platte; on the north are high open plains and prairies, and at nine miles from the Platte, the Musquitoe creek, and two or three small willow islands. We stayed here several days, during which we dried our provisions, made

new oars, and prepared our dispatches and maps of the country we had passed, for the president of the United States, to whom we intend to send them by a perioque from this place. The hunters have found game scarce in this neighbourhood; they have seen deer, turkies, and grouse; we have also an abundance of ripe grapes; and one of our men caught a white catfish, the eyes of which were small, and its tail resembling that of a dolphin. The present season is that in which the Indians go out into the prairies to hunt the buffaloe; but as we discovered some hunters' tracks, and observed the plains on fire in the direction of their villages, we hoped that they might have returned to gather the green Indian corn, and therefore dispatched two men to the Ottoes or Pawnee villages with a present of tobacco, and an invitation to the chiefs to visit us. They returned after two days absence. Their first course was through an open prairie to the south, in which they crossed Butterfly creek. They then reached a small beautiful river, called Corne de Cerf, or Elkhorn river, about one hundred yards wide, with clear water and a gravelly channel. It empties a little below the Ottoo village into the Platte, which they crossed, and arrived at the town about forty-five miles from our camp. They found no Indians there, though they saw some fresh tracks of a small party. The Ottoes were once a powerful nation, and lived about twenty miles above the Platte, on the southern bank of the Missouri. Being reduced, they mi-

grated to the neighbourhood of the Pawnees, under whose protection they now live. Their village is on the south side of the Platte, about thirty miles from its mouth; and their number is two hundred men, including about thirty families of Missouri Indians, who are incorporated with them. Five leagues above them, on the same side of the river, resides the nation of the Pawnees. This people were among the most numerous of the Missouri Indians, but have gradually been dispersed and broken, and even since the year 1797, have undergone some sensible changes. They now consist of four bands; the first is the one just mentioned, of about five hundred men, to whom of late years have been added the second band, who are called republican Pawnees, from their having lived on the republican branch of the river Kansas, whence they emigrated to join the principal band of Pawnees: the republican Pawnees amount to nearly two hundred and fifty men. The third, are the Pawnees Loups, or Wolf Pawnees, who reside on the Wolf fork of the Platte, about ninety miles from the principal Pawnees, and number two hundred and eighty men. The fourth band originally resided on the Kansas and Arkansaw, but in their wars with the Osages, they were so often defeated, that they at last retired to their present position on the Red river, where they form a tribe of four hundred men. All these tribes live in villages, and raise corn; but during the intervals of culture rove in the plains in quest of buffaloe.

Beyond them on the river, and westward of the Black mountains, are the Kaninaviesch, consisting of about four hundred men. They are supposed to have emigrated originally from the Pawnees nation; but they have degenerated from the improvements of the parent tribe, and no longer live in villages, but rove through the plains.

Still further to the westward, are several tribes, who wander and hunt on the sources of the river Platte, and thence to Rock mountain. These tribes, of which little more is known than the names and the population, are first, the Staitan, or Kite Indians, a small tribe of one hundred men. They have acquired the name of Kites, from their flying; that is, their being always on horseback; and the smallness of their numbers is to be attributed to their extreme ferocity; they are the most warlike of all the western Indians; they never yield in battle; they never spare their enemies; and the retaliation of this barbarity has almost extinguished the nation. Then come the Wetapahato, and Kiawa tribes, associated together, and amounting to two hundred men; the Castahana, of three hundred men, to which are to be added the Cataka of seventy-five men, and the Dotami. These wandering tribes, are conjectured to be the remnants of the Great Padouca nation, who occupied the country between the upper parts of the river Platte, and the river Kansas. They were visited by Bourgemont, in 1724, and then lived on the Kansas river. The seats, which he describes as their residence, are

now occupied by the Kansas nation; and of the Padoucas, there does not now exist even the name.

July 27. Having completed the object of our stay, we set sail with a pleasant breeze from the N. W. The two horses swam over to the southern shore, along which we went, passing by an island, at three and a half miles, formed by a pond, fed by springs: three miles further is a large sand island, in the middle of the river; the land on the south being high, and covered with timber; that on the north, a high prairie. At ten and a half miles from our encampment, we saw and examined a curious collection of graves or mounds, on the south side of the river. Not far from a low piece of land and a pond, is a tract of about two hundred acres in extent, which is covered with mounds of different heights, shapes, and sizes: some of sand, and some of both earth and sand; the largest being nearest the river. These mounds indicate the position of the ancient village of the Ottoes, before they retired to the protection of the Fawnees. After making fifteen miles, we encamped on the south, on the bank of a high handsome prairie, with lofty cottonwood in groves, near the river.

July 28. At one mile, this morning we reached a bluff, on the north, being the first highlands which approach the river on that side since we left the Nadawa. Above this, is an island and a creek, about fifteen yards wide, which, as it has no name, we called Indian Knob creek, from a number of

round knobs bare of timber, on the highlands, to the north. A little below the bluff, on the north, is the spot where the Ayauway Indians formerly lived. They were a branch of the Ottoes, and emigrated from this place to the river Desmoines. At ten and three quarter miles, we encamped on the north, opposite an island, in the middle of the river. The land, generally on the north, consists of high prairie and hills, with timber; on the south, low and covered with cottonwood. Our hunter brought to us in the evening, a Missouri Indian, whom he had found, with two others, dressing an elk; they were perfectly friendly, gave him some of the meat, and one of them agreed to accompany him to the boat. He is one of the few remaining Missouris, who live with the Ottoes: he belongs to a small party, whose camp is four miles from the river; and he says, that the body of the nation is now hunting buffaloe in the plains: he appeared quite sprightly, and his language resembled that of the Osage, particularly in his calling a chief, *inca*. We sent him back with one of our party next morning,

Sunday, July 29, with an invitation to the Indians, to meet us above on the river, and then proceeded. We soon came to a northern bend in the river, which runs within twenty yards of Indian Knob creek, the water of which is five feet higher than that of the Missouri. In less than two miles, we passed Boyer's creek on the north, of twenty-five yards width. We stopped to dine under a shade,

near the highland on the south, and caught several large catfish, one of them nearly white, and all very fat. Above this highland, we observed the traces of a great hurricane, which passed the river obliquely from N. W. to S. E. and tore up large trees, some of which perfectly sound, and four feet in diameter, were snapped off near the ground. We made ten miles to a wood on the north, where we encamped. The Missouri is much more crooked, since we passed the river Platte, though generally speaking, not so rapid; more of prairie, with less timber, and cottonwood in the low grounds, and oak, black walnut, hickory, and elm.

July 30. We went early in the morning, three and a quarter miles, and encamped on the south, in order to wait for the Ottoes. The land here consists of a plain, above the highwater level, the soil of which is fertile, and covered with a grass from five to eight feet high, interspersed with copses of large plums, and a currant, like those of the United States. It also furnishes two species of honeysuckle; one growing to a kind of shrub, common about Harrodsburgh (Kentucky), the other is not so high: the flowers grow in clusters, are short, and of a light pink colour; the leaves too, are distinct, and do not surround the stalk, as do those of the common honeysuckle of the United States. Back of this plain, is a woody ridge, about seventy feet above it, at the end of which we formed our camp. This ridge separates the lower from a higher prairie, of a good quality, with grass,

of ten or twelve inches in height, and extending back about a mile, to another elevation of eighty or ninety feet, beyond which is one continued plain. Near our camp, we enjoy from the bluffs a most beautiful view of the river, and the adjoining country. At a distance, varying from four to ten miles, and of a height between seventy and three hundred feet, two parallel ranges of highland afford a passage to the Missouri, which enriches the low grounds between them. In its winding course, it nourishes the willow islands, the scattered cottonwood, elm, sycamore, lynn, and ash, and the groves are interspersed with hickory, walnut, coffeenut, and oak.

July 31. The meridian altitude of this day made the latitude of our camp $41^{\circ} 18' 1\frac{4}{5}''$. The hunters supplied us with deer, turkies, geese, and beaver; one of the last was caught alive, and in a very short time was perfectly tamed. Catfish are very abundant in the river, and we have also seen a buffalofish. One of our men brought in yesterday an animal called, by the Pawnees, chocartoosh, and, by the French, blaireau, or badger. The evening is cool, yet the mosquitoes are still very troublesome.

We waited with much anxiety the return of our messenger to the Ottos. The men whom we dispatched to our last encampment, returned without having seen any appearance of its having been visited. Our horses too had strayed; but we were so fortunate as to recover them at the distance of

twelve miles. Our apprehensions were at length relieved by the arrival of a party of about fourteen Ottoo and Missouri Indians, who came at sunset, on the second of August, accompanied by a Frenchman, who resided among them, and interpreted for us. Captain Lewis and Clarke went out to meet them, and told them that we would hold a council in the morning. In the mean time we sent them some roasted meat, pork, flour, and meal; in return for which they made us a present of watermelons. We learned that our man Liberte had set out from their camp a day before them: we were in hopes that he had fatigued his horse, or lost himself in the woods, and would soon return; but we never saw him again.

August 3. The next morning the Indians, with their six chiefs, were all assembled under an awning, formed with the mainsail, in presence of all our party, paraded for the occasion. A speech was then made, announcing to them the change in the government, our promises of protection, and advice as to their future conduct. All the six chiefs replied to our speech, each in his turn, according to rank: they expressed their joy at the change in the government; their hopes that we would recommend them to their great father (the president), that they might obtain trade and necessaries; they wanted arms as well for hunting as for defence, and asked our mediation between them and the Mahas, with whom they are now at war. We promised to do so, and wished some

of them to accompany us to that nation, which they declined, for fear of being killed by them. We then proceeded to distribute our presents. The grand chief of the nation not being of the party, we sent him a flag, a medal, and some ornaments for clothing. To the six chiefs who were present, we gave a medal of the second grade to one Ottoe chief, and one Missouri chief; a medal of the third grade to two inferior chiefs of each nation: the customary mode of recognizing a chief, being to place a medal round his neck, which is considered among his tribe as a proof of his consideration abroad. Each of these medals was accompanied by a present of paint, garters, and cloth ornaments of dress; and to this we added a cannister of powder, a bottle of whiskey, and a few presents to the whole, which appeared to make them perfectly satisfied. The air-gun too was fired, and astonished them greatly. The absent grand chief was an Ottoe, named Weahrushhah, which, in English, degenerates into Little Thief. The two principal chieftains present were, Shongotongo, or Big Horse; and Wethea, or Hospitality; also Shosguscan, or White Horse, an Ottoe: the first an Ottoe, the second a Missouri. The incidents just related, induced us to give to this place the name of the Council-bluff; the situation of it is exceedingly favourable for a fort and trading factory, as the soil is well calculated for bricks, and there is an abundance of wood in the neighbourhood, and the air being pure and healthy. It is also

central to the chief resorts of the Indians: one day's journey to the Ottoes; one and a half to the great Pawnees; two days from the Mahas; two and a quarter from the Pawnees Loups village; convenient to the hunting grounds of the Sioux; and twenty-five days journey to Santa Fé.

The ceremonies of the council being concluded, we set sail in the afternoon, and encamped at the distance of five miles, on the south side, where we found the mosquitoes very troublesome.

August 4. A violent wind, accompanied by rain, purified and cooled the atmosphere last night; we proceeded early, and reached a very narrow part of the river, where the channel is confined within a space of two hundred yards, by a sand point on the north, and a bend on the south; the banks in the neighbourhood washing away, the trees falling in, and the channel filled with buried logs. Above this is a trading house, on the south, where one of our party passed two years, trading with the Mahas. At nearly four miles, is a creek on the south, emptying opposite a large island of sand; between this creek and our last night's encampment, the river has changed its bed, and encroached on the southern shore. About two miles further, is another creek on the south, which, like the former, is the outlet of three ponds, communicating with each other, and forming a small lake, which is fed by streams from the highlands. At fifteen miles, we encamped on the south. The hills on both sides of the river are nearly twelve

or fifteen miles from each other; those of the north containing some timber, while the hills of the south are without any covering, except some scattering wood in the ravines, and near where the creeks pass into the hills; rich plains and prairies occupying the intermediate space, and partially covered, near the water, with cottonwood. There has been a great deal of pumice stone on the shore to-day.

August 5. We set out early, and, by means of our oars, made twenty and a half miles, though the river was crowded with sandbars. On both sides the prairies extend along the river; the banks being covered with great quantities of grapes, of which three different species are now ripe; one large and resembling the purple grape. We had some rain this morning, attended by high wind; but generally speaking, have remarked that thunder storms are less frequent than in the Atlantic states, at this season. Snakes too are less frequent, though we killed one to-day of the shape and size of the rattlesnake, but of a lighter colour. We fixed our camp on the north side. In the evening, Captain Clarke, in pursuing some game, in an eastern direction, found himself at the distance of three hundred and seventy yards from the camp, at a point of the river whence we had come twelve miles. When the water is high, this peninsula is overflowed, and judging from the customary and notorious changes in the river, a few years will be sufficient to force the main current of the river across, and leave the great bend dry. The whole

lowland between the parallel range of hills seems formed of mud or ooze of the river, at some former period, mixed with sand and clay. The sand of the neighbouring banks accumulates with the aid of that brought down the stream, and forms sandbars, projecting into the river; these drive the channel to the opposite banks, the loose texture of which it undermines, and at length deserts its ancient bed for a new and shorter passage; it is thus that the banks of the Missouri are constantly falling, and the river changing its bed.

August 6. In the morning, after a violent storm of wind and rain from N. W. we passed a large island to the north. In the channel separating it from the shore, a creek called Soldier's river enters; the island kept it from our view, but one of our men who had seen it, represents it as about forty yards wide at its mouth. At five miles, we came to a bend of the river towards the north, a sandbar, running in from the south, had turned its course so as to leave the old channel quite dry. We again saw the same appearance at our encampment, twenty and a half miles distant on the north side. Here the channel of the river had encroached south, and the old bed was without water, except a few ponds. The sandbars are still very numerous.

August 7. We had another storm from the N. W. in the course of the last evening; in the morning we proceeded, having the wind from the north, and encamped on the northern shore, hav-

ing rowed seventeen miles. The river is here encumbered with sandbars, but no islands, except two small ones, called Detachment islands, and formed on the south side by a small stream.

We dispatched four men back to the Ottoes village in quest of our man, Liberte, and to apprehend one of the soldiers, who left us on the 4th, under pretence of recovering a knife which he had dropped a short distance behind, and who we fear has deserted. We also sent small presents to the Ottoes and Missouris, and requested that they would join us at the Maha village, where a peace might be concluded between them.

August 8. At two miles distance, this morning, we came to a part of the river, where there was concealed timber difficult to pass. The wind was from the N.W. and we proceeded in safety. At six miles, a river empties on the northern side, called by the Sioux Indians, Eaneahwadepon, or Stone river; and by the French, Petite Riviere des Sioux, or Little Sioux river. At its confluence it is eighty yards wide. Our interpreter, Mr. Durion, who has been to the sources of it, and knows the adjoining country, says that it rises within about nine miles of the river Desmoines; that within fifteen leagues of that river it passes through a lake nearly sixty miles in circumference, and divided into two parts by rocks which approach each other very closely: its width is various: it contains many islands, and is known by the name of the Lac d'Esprit: it is near the Dogplains,

and within four days march of the Mahas. The country watered by it, is open and undulating, and may be visited in boats up the river for some distance. The Desmoines, he adds, is about eighty yards wide where the Little Sioux river approaches it: it is shoaly, and one of the principal branches is called Cat River. Two miles beyond this river is a long island, which we called Pelican Island, from the numbers of that animal which were feeding on it: one of these being killed, we poured into his bag five gallons of water. An elk, too, was shot, and we had again to remark, that snakes are rare in this part of the Missouri. A meridian altitude near the Little Sioux river, made the latitude $41^{\circ} 42' 34''$. We encamped on the north, having come sixteen miles.

August 9. A thick fog detained us until past seven o'clock, after which we proceeded with a gentle breeze from the south-east. After passing two sandbars, we reached at seven and a half miles, a point of high land on the left, near which the river has forced itself a channel across a peninsula, leaving on the right a circuit of twelve or eighteen miles, which is now recognised by the ponds and islands it contains. At seventeen and a half miles, we reached a point on the north, where we encamped. The hills are at a great distance from the river for the last several days; the land on both sides low, and covered with cotton-wood and abundance of grape-vines. An elk was seen to-day, a turkey also shot, and near our camp is a

beaver den: the mosquitoes have been more troublesome than ever for the two last days.

August 10. At two and a half miles, we came to a place called Coupee a Jacques, where the river has found a new bed, and abridged a circuit of several miles: at twelve and a half miles, a cliff of yellow stone on the left. This is the first high land near the river above the Council-bluff. After passing a number of sand-bars, we reached a willow island at the distance of twenty-two and a half miles, which we were enabled to do with our oars and a wind from the S.W. and encamped on the north side.

August 11. After a violent wind from the N.W. attended with rain, we sailed along the right of the island. At nearly five miles, we halted on the south side, for the purpose of examining a spot where one of the great chiefs of the Mahas, named Blackbird, who died about four years ago of the small-pox, was buried. A hill of yellow soft sandstone rises from the river in bluffs of various heights, till it ends in a knoll about three hundred feet above the water; on the top of this a mound of twelve feet diameter at the base, and six feet high, is raised over the body of the deceased king; a pole of about eight feet high is fixed in the centre; on which we placed a white flag, bordered with red, blue and white. The Blackbird seems to have been a personage of great consideration, for ever since his death he is supplied with provisions, from time to time by the

superstitious regard of the Mahas. We descended to the river and passed a small creek on the south, called by the Mahas, Waucandipeeche, (Great Spirit is bad.) Near this creek and the adjoining hills, the Mahas had a village, and lost four hundred of their nation by the dreadful malady which destroyed the Blackbird. The meridian altitude made the latitude $42^{\circ} 1' 31''$ north. We encamped at seventeen miles distance, on the north side in a bend of the river. During our day's course, it has been crooked; we observed a number of places in it where the old channel is filled up, or gradually becoming covered with willow and cottonwood; great numbers of *herons* are observed to-day, and the mosquitoes annoy us very much.

August 12. A gentle breeze from the south, carried us along about ten miles, when we stopped to take a meridian altitude, and sent a man across to our place of observation yesterday: he stepped nine hundred and seventy-four yards, and the distance we had come round, was eighteen miles and three quarters. The river is wider and shallower than usual. Four miles beyond this bend a bluff begins, and continues several miles; on the south it rises from the water at different heights, from twenty to one hundred and fifty feet, and higher as it recedes on the river: it consists of yellow and brown clay, with soft sandstone imbedded in it, and is covered with timber, among which may be observed some red cedar: the lands on the opposite side are low and subject to inundation, but contain

willows, cottonwood, and many grapes. A prairie-wolf came near the bank and barked at us; we attempted unsuccessfully to take him. This part of the river abounds in beaver. We encamped on a sand island in a bend to the north, having made twenty miles and a quarter.

August 13. Set out at daylight with a breeze from the south-east, and passed several sandbars. Between ten and eleven miles, we came to a spot on the south, where a Mr. Mackay had a trading establishment in the years 1795 and 1796, which he called Fort Charles. At fourteen miles, we reached a creek on the south, on which the Mahas reside, and at seventeen miles and a quarter, formed a camp on a sandbar, to the south side of the river, opposite the lower point of a large island. From this place Sergeant Ordway and four men were detached to the Maha village with a flag and a present, in order to induce them to come and hold a council with us. They returned at twelve o'clock the next day, August 14. After crossing a prairie covered with high grass, they reached the Maha creek, along which they proceeded to its three forks, which join near the village: they crossed the north branch and went along the south; the walk was very fatiguing, as they were forced to break their way through grass, sun-flowers, and thistles, all above ten feet high, and interspersed with wild pea. Five miles from our camp they reached the position of the ancient Maha village: it had once consisted of three hundred cabins, but was burnt about four

years ago, soon after the smallpox had destroyed four hundred men, and a proportion of women and children. On a hill, in the rear of the village, are the graves of the nation; to the south of which runs the fork of the Maha creek: this they crossed where it was about ten yards wide, and followed its course to the Missouri, passing along a ridge of hill for one and a half mile, and a long pond between that and the Missouri: they then recrossed the Maha creek, and arrived at the camp, having seen no tracks of Indians nor any sign of recent cultivation.

In the morning 15th, some men were sent to examine the cause of a large smoke from the north-east, and which seemed to indicate that some Indians were near; but they found that a small party, who had lately passed that way, had left some trees burning, and that the wind from that quarter blew the smoke directly towards us: our camp lies about three miles north-east from the old Maha village, and is in latitude $42^{\circ} 13' 41''$. The accounts we have had of the effects of the smallpox on that nation are most distressing; it is not known in what way it was first communicated to them, though probably by some war party. They had been a military and powerful people; but when these warriors saw their strength wasting before a malady which they could not resist, their phrensy was extreme; they burnt their village, and many of them put to death their wives and children, to save them

from so cruel an affliction, and that all might go together to some better country.

On the 16th, we still waited for the Indians: a party had gone out yesterday to the Maha creek, which was dammed up by the beaver between the camp and the village: a second went to-day. They made a kind of drag with small willows and bark, and swept the creek: the first company brought three hundred and eighteen, the second upwards of eight hundred, consisting of pike, bass, fish resembling salmon, trout, redhorse, buffaloe, one rockfish, one flatback, perch, catfish, a small species of perch called, on the Ohio, silverfish, a shrimp of the same size, shape, and flavour of those about New Orleans, and the lower part of the Mississippi. We also found very fat muscles; and on the river as well as the creek, are different kinds of ducks and plover. The wind, which in the morning had been from the north-west, shifted round in the evening to the south-east, and as usual we had a breeze that cooled the air and relieved us from the musquitoes, which generally give us great trouble.

Friday, 17. The wind continued from the south-east, and the morning was fair. We observe about us a grass resembling wheat, except that the grain is like rye, also some similar to both rye and barley, and a kind of timothy, the seed of which branches from the main stock, and is more like a flax-seed than a timothy. In the evening one of the party sent to the Ottoes, returned with the information

that the rest were coming on with the deserter: they had also caught Liberte, but, by a trick, he made his escape: they were bringing three of the chiefs in order to engage our assistance in making peace with the Mahas. This nation having left their village, that desirable purpose cannot be effected; but in order to bring in any neighbouring tribes, we set the surrounding prairies on fire. This is the customary signal made by traders to apprize the Indians of their arrival: it is also used between different nations as an indication of any event which they have previously agreed to announce in that way; and as soon as it is seen collects the neighbouring tribes, unless they apprehend that it is made by their enemies.

August 18. In the afternoon the party arrived with the Indians, consisting of the Little Thief and the Big Horse, whom we had seen on the third, together with six other chiefs, and a French interpreter. We met them under a shade, and after they had finished a repast with which we supplied them, we inquired into the origin of the war between them and the Mahas, which they related with great frankness. It seems that two of the Missouris went to the Mahas to steal horses, but were detected and killed; the Ottoes and Missouris thought themselves bound to avenge their companions, and the whole nations were at last obliged to share in the dispute; they are also in fear of a war from the Pawnees, whose village they entered this summer, while the inhabitants were hunting, and

stole their corn. This ingenuous confession did not make us the less desirous of negotiating a peace for them; but no Indians have as yet been attracted by our fire. The evening was closed by a dance; and the next day,

August 19, the chiefs and warriors being assembled at ten o'clock, we explained the speech we had already sent from the Council-bluffs, and renewed our advice. They all replied in turn, and the presents were then distributed: we exchanged the small medal we had formerly given to the Big Horse for one of the same size with that of Little Thief: we also gave a small medal to a third chief, and a kind of certificate or letter of acknowledgment to five of the warriors, expressive of our favor and their good intentions: one of them dissatisfied, returned us the certificate; but the chief, fearful of our being offended, begged that it might be restored to him; this we declined, and rebuked them severely for having in view mere traffic instead of peace with their neighbours. This displeased them at first; but they at length all petitioned that it should be given to the warrior, who then came forward and made an apology to us; we then delivered it to the chief to be given to the most worthy, and he bestowed it on the same warrior, whose name was Great Blue Eyes. After a more substantial present of small articles and tobacco, the council was ended with a dram to the Indians. In the evening we exhibited different objects of curiosity, and particularly the airgun, which gave them great

surprise. Those people are almost naked, having no covering, except a sort of breechcloth round the middle, with a loose blanket or buffaloe robe painted, thrown over them. The names of these warriors, besides those already mentioned were Karkapaha, (or Crow's head) and Nenasawa (or Black Cat) Missouris; and Sananona (or Iron Eyes) Neswaunja (or Big Ox) Stageaunja (or Big Blue Eyes) and Wasashaco (or Brave Man) all Ottoes. These two tribes speak very nearly the same language: they all begged us to give them whiskey.

The next morning, August 20, the Indians mounted their horses and left us, having received a cannister of whiskey at parting. We then set sail, and after passing two islands on the north, came to on that side under some bluffs; the first near the river since we left the Ayauwa village. Here we had the misfortune to lose one of our sergeants, Charles Floyd. He was yesterday seized with a bilious cholic, and all our care and attention were ineffectual to relieve him: a little before his death, he said to Captain Clarke, "I am going to leave you;" his strength failed him as he added "I want you to write me a letter;" but he died with a composure which justified the high opinion we had formed of his firmness and good conduct. He was buried on the top of the bluff with the honours due to a brave soldier; and the place of his interment marked by a cedar post, on which his name and the day of his death were inscribed. About a mile beyond this place, to which we gave his name,

is a small river about thirty yards wide, on the north, which we called Floyd's river, where we encamped. We had a breeze from the south-east, and made thirteen miles.

August 21. The same breeze from the south-east carried us by a small willow creek on the north, about one mile and a half above Floyd's river. Here began a range of bluffs, which continued till near the mouth of the great Sioux river, three miles beyond Floyd's. This river comes in from the north, and is about one hundred and ten yards wide. Mr. Durion, our Sioux interpreter, who is well acquainted with it, says that it is navigable upwards of two hundred miles to the Falls, and even beyond them; that its sources are near those of the St. Peter's. He also says, that below the Falls a creek falls in from the eastward, after passing through cliffs of red rock: of this the Indians make their pipes; and the necessity of procuring that article, has introduced a sort of law of nations, by which the banks of the creek are sacred, and even tribes at war meet without hostility at these quarries, which possess a right of asylum. Thus we find even among savages certain principles deemed sacred, by which the rigours of their merciless system of warfare are mitigated. A sense of common danger, where stronger ties are wanting, gives all the binding force of more solemn obligations. The importance of preserving the known and settled rules of warfare among civilized nations, in all their integrity, becomes strikingly evident; since even

savages, with their few precarious wants, cannot exist in a state of peace or war where this faith is once violated. The wind became southerly, and blew with such violence that we took a reef in our sail: it also blew the sand from the bars in such quantities, that we could not see the channel at any distance ahead. At four and a quarter miles, we came to two willow islands, beyond which are several sandbars; and at twelve miles, a spot where the Mahas once had a village, now no longer existing. We again passed a number of sandbars, and encamped on the south; having come twenty-four and three quarter miles. The country through which we passed has the same uniform appearance ever since we left the river Platte: rich low-grounds near the river, succeeded by undulating prairies, with timber near the waters. Some wolves were seen to-day on the sandbeaches to the south; we also procured an excellent fruit, resembling a red currant, growing on a shrub like the privy, and about the height of a wild plum.

August 22. About three miles distant, we joined the men who had been sent from the Maha village with our horses, and who brought us two deer. The bluffs or hills which reach the river at this place, on the south, contain allum, copperas, cobalt, which had the appearance of soft isinglass, pyrites, and sandstone, the two first very pure. Above this bluff comes in a small creek on the south, which we call Rologe creek. Seven miles above is another cliff, on the same side, of alum rock,

of a dark brown colour, containing in its crevices great quantities of cobalt, cemented shells, and red earth. From this the river bends to the eastward, and approaches the Sioux river within three or four miles. We sailed the greater part of the day, and made nineteen miles to our camp on the north side. The sandbars are as usual numerous: there are also considerable traces of elk; but none are yet seen. Captain Lewis in proving the quality of some of the substances in the first cliff, was considerably injured by the fumes and taste of the cobalt, and took some strong medicines to relieve him from its effects. The appearance of these mineral substances enables us to account for disorders of the stomach, with which the party had been affected since they left the river Sioux. We had been in the habit of dipping up the water of the river inadvertently and making use of it, till, on examination, the sickness was thought to proceed from a scum covering the surface of the water, along the southern shore, and which, as we now discovered, proceeded from these bluffs. The men had been ordered, before we reached the bluffs, to agitate the water, so as to disperse the scum, and take the water, not at the surface, but at some depth. The consequence was, that these disorders ceased: the biles too which had afflicted the men, were not observed beyond the Sioux river. In order to supply the place of Serjeant Floyd, we permitted the men to name three persons, and Patrick Gass having the greatest number of votes was made a serjeant.

August 23. We set out early, and at four miles came to a small run between cliffs of yellow and blue earth: the wind, however, soon changed, and blew so hard from the west, that we proceeded very slowly; the fine sand from the bar being driven in such clouds, that we could scarcely see. Three and a quarter miles beyond this run, we came to a willow island, and a sand island opposite, and encamped on the south side, at ten and a quarter miles. On the north side is an extensive and delightful prairie, which we called Buffaloe prairie, from our having here killed the first buffaloe. Two elks swam the river to-day and were fired at, but escaped: a deer was killed from the boat; one beaver was killed; and several prairie wolves were seen.

August 24. It began to rain last night, and continued this morning: we proceeded, however, two and a quarter miles, to the commencement of a bluff of blue clay, about one hundred and eighty, or one hundred and ninety feet on the south side: it seems to have been lately on fire; and even now the ground is so warm that we cannot keep our hands in it at any depth: there are strong appearances of coal, and also great quantities of cobalt, or a chrysalized substance resembling it. There is a fruit now ripe which looks like a currant, except that it is double the size, and grows on a bush like a privy, the size of a damson, and of a delicious flavour; its Indian name means rabbit-berries. We then passed, at the distance of about seven miles,

the mouth of a creek on the north side, called by an Indian name, meaning Whitestone river. The beautiful prairie of yesterday has changed into one of greater height, and very smooth and extensive. We encamped on the south side, at ten and a quarter miles, and found ourselves much annoyed by the mosquitoes.

CHAPTER III.

WHIMSICAL INSTANCE OF SUPERSTITION OF THE SIOUX INDIANS — COUNCIL HELD WITH THE SIOUX — CHARACTER OF THAT TRIBE, THEIR MANNERS, &c. — A RIDICULOUS INSTANCE OF THEIR HEROISM — ANCIENT FORTIFICATIONS — QUICURRE RIVER DESCRIBED — VAST HERDS OF BUFFALOE — ACCOUNT OF THE PETIT CHIEN OR LITTLE DOG — NARROW ESCAPE OF GEORGE SHANNON — DESCRIPTION OF WHITERIVER — SURPRISING FLEETNESS OF THE ANTELOPE — PASS THE RIVER OF THE SIOUX — DESCRIPTION OF THE GRAND DE TOUR, OR GREAT BEND — ENCAMP ON THE TETON RIVER.

AUGUST 25. Captains Lewis and Clarke, with ten men, went to see an object deemed very extraordinary among all the neighbouring Indians. They dropped down to the mouth of Whitestone river, about thirty yards wide, where they left the boat, and at the distance of two hundred yards, ascended a rising ground from which a plain extended itself as far as the eye could discern. After walking four miles, they crossed the creek where it is twenty-three yards wide, and waters an extensive valley. The heat was so oppressive that we were obliged to send back our dog to the creek, as he was unable to bear the fatigue; and it was not

till after four hours march that we reached the object of our visit. This was a large mound in the midst of the plain about N. 20° W. from the mouth of Whitestone river, from which it is nine miles distant. The base of the mound is a regular parallelogram, the longest side being about three hundred yards, the shorter sixty or seventy : from the longest side it rises with a steep ascent from the north and south to the height of sixty-five or seventy feet, leaving on the top a level plain of twelve feet in breadth and ninety in length. The north and south extremities are connected by two oval borders which serve as new bases, and divide the whole side into three steep but regular gradations from the plain. The only thing characteristic in this hill is its extreme symmetry, and this, together with its being totally detached from the other hills which are at the distance of eight or nine miles, would induce a belief that it was artificial ; but, as the earth and the loose pebbles which compose it, are arranged exactly like the steep grounds on the borders of the creek, we concluded from this similarity of texture that it might be natural. But the Indians have made it a great article of their superstition : it is called the mountain of Little People, or Little Spirits, and they believe that it is the abode of little devils, in the human form, of about eighteen inches high, and with remarkably large heads ; they are armed with sharp arrows, with which they are very skilful, and are always on the watch to kill those who should have the hardi-

hood to approach their residence. The tradition is, that many have suffered from these little evil spirits, and among others, three Maha Indians fell a sacrifice to them a few years since. This has inspired all the neighbouring nations, Sioux, Mahas, and Ottoes, with such terror, that no consideration could tempt them to visit the hill.

We saw none of these wicked little spirits, nor any place for them, except some small holes scattered over the top : we were happy enough to escape their vengeance, though we remained some time on the mound to enjoy the delightful prospect of the plain, which spreads itself out till the eye rests upon the N. W. hills at a great distance, and those of the N. E. still farther on, enlivened by large herds of buffaloe feeding at a distance. The soil of these plains is exceedingly fine ; there is, however, no timber except on the Missouri : all the woods of the Whitestone river not being sufficient to cover thickly one hundred acres. The plain country which surrounds this mound has contributed not a little to its bad reputation : the wind driving from every direction over the level ground obliges the insects to seek shelter on its leeward side, or be driven against us by the wind. The small birds, whose food they are, resort of course in great numbers in quest of subsistence ; and the Indians always seem to discover an unusual assemblage of birds as produced by some supernatural cause : among them we observed the brown martin employed in looking for insects, and so gentle that

they did not fly until we got within a few feet of them. We have also distinguished among the numerous birds of the plain, the blackbird, the wren or prairie bird, and a species of lark about the size of a partridge, with a short tail. The excessive heat and thirst forced us from the hill, about one o'clock to the nearest water, which we found in the creek, at three miles distance, and remained an hour and a half. We then went down the creek, through a lowland about one mile in width, and crossed it three times, to the spot where we first reached it in the morning. Here we gathered some delicious plums, grapes, and blue currants, and afterwards arrived at the mouth of the river about sunset. To this place the course from the mound is S. twenty miles, E. nine miles; we there resumed our perioque, and on reaching our encampment of last night set the prairies on fire, to warn the Sioux of our approach. In the mean time, the boat under Sergeant Pryor had proceeded in the afternoon one mile, to a bluff of blue clay on the south, and after passing a sandbar and two sand islands fixed their camp at the distance of six miles on the south. In the evening some rain fell. We had killed a duck and several birds: in the boat, they had caught some large catfish.

Sunday, August 26. We rejoined the boat at 9 o'clock before she set out, and then passing by an island, and under a cliff on the south, nearly two miles in extent, and composed of white and blue earth, encamped at nine miles distance, on

a sandbar towards the north. Opposite to this, on the south, is a small creek called Petit Arc or Little Bow, and a short distance above it, an old village of the same name. This village, of which nothing remains but the mound of earth about four feet high surrounding it, was built by a Maha chief named Little Bow, who, being displeased with Blackbird, the late king, seceded with two hundred followers, and settled at this spot, which is now abandoned, as the two villages have reunited since the death of Blackbird. We have great quantities of grapes, and plums of three kinds; two of a yellow colour, and distinguished by one of the species being longer than the other; and a third round and red: all have an excellent flavour, particularly those of the yellow kind.

August 27. The morning star appeared much larger than usual. A gentle breeze from the south-east carried us by some large sandbars, on both sides and in the middle of the river, to a bluff, on the south side, seven and a half miles distant: this bluff is of white clay or chalk, under which is much stone, like lime, incrustated with a clear substance, supposed to be cobalt, and some dark ore. Above this bluff we set the prairie on fire, to invite the Sioux. After twelve and a half miles, we had passed several other sandbars, and now reached the mouth of a river called by the French Jacques (James river) or Yankton, from the tribe which inhabits its banks. It is about ninety yards wide at the confluence: the country which it waters

is rich prairie, with little timber: it becomes deeper and wider above its mouth, and may be navigated a great distance; as its sources rise near those of St. Peter's, of the Mississippi, and the red river of lake Winnipeg. As we came to the mouth of the river, an Indian swam to the boat; and, on our landing, we were met by two others, who informed us that a large body of Sioux were encamped near us: they accompanied three of our men, with an invitation to meet us at a spot above the river: the third Indian remained with us: he is a Maha boy, and says that his nation have gone to the Pawnees to make peace with them. At fourteen miles, we encamped on a sandbar to the north. The air was cool, the evening pleasant, the wind from the south-east, and light. The river has fallen gradually, and is now low.

Tuesday 28th. We passed, with a stiff breeze from the south, several sandbars. On the south is a prairie which rises gradually from the water to the height of a bluff, which is, at four miles distance, of a whitish colour, and about seventy or eighty feet high. Further on is another bluff, of a brownish colour, on the north side; and at the distance of eight and a half miles is the beginning of Calumet bluff, on the south side, under which we formed our camp, in a beautiful plain, to wait the arrival of the Sioux. At the first bluff the young Indian left us and joined their camp. Before reaching Calumet bluff, one of the perioques ran upon a log in the river, and was rendered unfit

for service; so that all our loading was put into the second perioque. On both sides of the river are fine prairies, with cottonwood; and near the bluff there is more timber in the points and valleys than we have been accustomed to see.

Wednesday, 29th. We had a violent storm of wind and rain last evening; and were engaged during the day in repairing the perioque, and other necessary occupations; when, at four o'clock in the afternoon, Sergeant Pryor and his party arrived on the opposite side, attended by five chiefs, and about seventy men and boys. We sent a boat for them, and they joined us, as did also Mr. Durion, the son of our interpreter, who happened to be trading with the Sioux at this time. He returned with Sergeant Pryor to the Indians, with a present of tobacco, corn, and a few kettles; and told them that we would speak to their chiefs in the morning. Sergeant Pryor reported, that on reaching their village, which is at twelve miles distance from our camp, he was met by a party with a buffaloe robe, on which they desired to carry their visitors: an honour which they declined, informing the Indians that they were not the commanders of the boats: as a great mark of respect, they were then presented with a fat dog, already cooked, of which they partook heartily, and found it well flavoured. The camps of the Sioux are of a conical form, covered with buffaloe robes, painted with various figures and colours, with an aperture in the top for the smoke to pass through. The lodges con-

tain from ten to fifteen persons, and the interior arrangement is compact and handsome, each lodge having a place for cooking detached from it.

August 30th. Thursday. The fog was so thick that we could not see the Indian camp on the opposite side, but it cleared off about eight o'clock. We prepared a speech and some presents, and then sent for the chiefs and warriors, whom we received, at twelve o'clock, under a large oak tree, near to which the flag of the United States was flying. Captain Lewis delivered a speech, with the usual advice and counsel for their future conduct. We then acknowledged their chiefs, by giving to the grand chief a flag, a medal, a certificate, with a string of wampum; to which we added a chief's coat; that is, a richly laced uniform of the United States artillery corps, and a cocked hat, and red feather. One second chief and three inferior ones were made or recognised by medals, and a suitable present of tobacco, and articles of clothing. We then smoked the pipe of peace, and the chiefs retired to a bower, formed of bushes, by their young men, where they divided among each other the presents, and smoked and ate, and held a council on the answer which they were to make us tomorrow. The young people exercised their bows and arrows in shooting at marks for beads, which we distributed to the best marksmen; and in the evening the whole party danced until a late hour, and in the course of their amusement we threw among them some knives, tobacco, bells, tape, and

binding, with which they were much pleased. Their musical instruments were the drum, and a sort of little bag made of buffaloe hide, dressed white, with small shot or pebbles in it, and a bunch of hair tied to it. This produces a sort of rattling music, with which the party was annoyed by four musicians during the council this morning.

August 31. In the morning, after breakfast, the chiefs met, and sat down in a row, with pipes of peace, highly ornamented, and all pointed towards the seats intended for captains Lewis and Clarke. When they arrived and were seated, the grand chief, whose Indian name, Weucha, is in English, Shake Hand, and in French is called *Le Libérateur* (the deliverer) rose, and spoke at some length, approving what we had said, and promising to follow our advice:

"I see before me," said he, "my great father's two sons. You see me and the rest of our chiefs and warriors. We are very poor; we have neither powder nor ball, nor knives; and our women and children at the village have no clothes. I wish that as my brothers have given me a flag and a medal, they would give something to those poor people, or let them stop and trade with the first boat which comes up the river. I will bring chiefs of the Pawnees and Mahas together, and make peace between them; but it is better that I should do it than my great father's sons, for they will listen to me more readily. I will also take some chiefs to your country in the spring; but before that time I cannot leave home. I went formerly to the

English, and they gave me a medal and some clothes; when I went to the Spanish they gave me a medal, but nothing to keep it from my skin; but now you give me medal and clothes. But still we are poor; and I wish brothers, you would give us something for our squaws."

When he sat down, Mahtoree, or White Crane, rose:

"I have listened," said he, "to what our father's words were yesterday; and I am, to-day, glad to see how you have dressed our old chief: I am a young man, and do not wish to talk much: my fathers have made me a chief: I had much sense before, but now I think I have more than ever. What the old chief has declared, I will confirm, and do whatever he and you please; but I wish that you would take pity on us, for we are very poor."

Another chief, called Pawnawneahpahbe, then said:

"I am a young man, and know but little: I cannot speak well; but I have listened to what you have told the old chief, and will do whatever you agree."

The same sentiments were then repeated by Awea-wechache.

We were surprized at finding that the first of these titles means "Struck by the Pawnee," and was occasioned by some blow which the chief had received in battle, from one of the Pawnee tribe. The second is, in English, "Half Man," which seems a singular name for a warrior, till it was ex-

plained to have its origin, probably, in the modesty of the chief; who, on being told of his exploits, would say, "I am no warrior: I am only half a man." The other chiefs spoke very little; but after they had finished, one of the warriors delivered a speech, in which he declared he would support them. They promised to make peace with the Ottoes and Missouris, the only nations with whom they are at war. All these harangues concluded by describing the distress of the nation; they begged us to have pity on them; to send them traders; that they wanted powder and ball; and seemed anxious that we should supply them with some of their great father's milk, the name by which they distinguish ardent spirits. We then gave some tobacco to each of the chiefs, and a certificate to two of the warriors who attended the chief. We prevailed on Mr. Durion to remain here, and accompany as many of the Sioux chiefs as he could collect, down to the seat of government. We also gave his son a flag, some clothes, and provisions, with directions to bring about a peace between the surrounding tribes, and to convey some of their chiefs to see the president. In the evening they left us, and encamped on the opposite bank, accompanied by the two Durions. During the evening and night we had much rain, and observed that the river rises a little. The Indians who have just left us are the Yanktons, a tribe of the great nation of Sioux. These Yanktons are about two hundred men in number; and inhabit

the Jacques, Desmoines, and Sioux rivers. In person they are stout, well proportioned, and have a certain air of dignity and boldness. In their dress they differ nothing from the other bands of the nation whom we saw, and will describe afterwards: they are fond of decorations, and use paint, and porcupine quills, and feathers. Some of them wore a kind of necklace of white bears' claws, three inches long, and closely strung together round their necks. They have only a few fowling-pieces, being generally armed with bows and arrows, in which, however, they do not appear as expert as the more northern Indians. What struck us most was an institution, peculiar to them, and to the Kite Indians, further to the westward, from whom it is said to have been copied. It is an association of the most active and brave young men, who are bound to each other by attachment, secured by a vow never to retreat before any danger, or give way to their enemies. In war they go forward without sheltering themselves behind trees, or aiding their natural valour by any artifice. This punctilious determination, not to be turned from their course, became heroic or ridiculous, a short time since, when the Yanktons were crossing the Missouri on the ice. A hole lay immediately in their course, which might easily have been avoided by going round. This the foremost of the band disdained to do; but went straight forward, and was lost. The others would have followed his example, but were forcibly prevented by the rest of the tribe. These young men sit, and

encamp, and dance together, distinct from the rest of the nation: they are generally about thirty or thirty-five years old; and such is the deference paid to courage, that their seats in council are superior to those of the chiefs, and their persons more respected. But, as may be supposed, such indiscreet bravery will soon diminish the numbers of those who practise it; so that the band is now reduced to four warriors, who were among our visitors. These were the remains of twenty-two, who composed the society not long ago; but in a battle with the Kite Indians, of the Black Mountains, eighteen of them were killed, and these four were dragged from the field by their companions.

Whilst these Indians remained with us, we made very minute enquiries relative to their situation and numbers, and trade and manners. This we did very satisfactorily, by means of two different interpreters; and from their accounts, joined to our interviews with other bands of the same nation, and much intelligence acquired since, we were enabled to understand, with some accuracy, the condition of the Sioux hitherto so little known.

The Sioux, or Dacorta Indians, originally settled on the Mississippi, and called by Carver, Madowesians, are now subdivided into tribes, as follow:

First, The Yanktons: this tribe inhabits the Sioux, Desmoines, and Jacques rivers, and number about two hundred warriors.

Second, The Tetons of the burnt woods. This tribe numbers about three hundred men, who rove

on both sides of the Missouri, the White and Teton rivers.

Third, The Tetons Okandandas, a tribe consisting of about one hundred and fifty men, who inhabit both sides of the Missouri below the Chayenne river.

Fourth, Tetons Minnakenozzo, a nation inhabiting both sides of the Missouri, above the Chayenne river, and containing about two hundred and fifty men.

Fifth, Tetons Saone; these inhabit both sides of the Missouri below the Warreconne river, and consist of about three hundred men.

Sixth, Yanktons of the Plains, or Big Devils; who rove on the heads of the Sioux, Jacques, and Red river; the most numerous of all the tribes, and number about five hundred men.

Seventh, Wahpatone; a nation residing on the St. Peter's, just above the mouth of that river, and numbering two hundred men.

Eighth, Mindawarcarton, or proper Dacorta or Sioux Indians. These possess the original seat of the Sioux, and are properly so denominated. They rove on both sides of the Mississippi, about the Falls of St. Anthony, and consist of three hundred men.

Ninth, The Wahpatoota, or Leaf Beds. This nation inhabits both sides of the river St. Peter's, below Yellow wood river, amounting to about one hundred and fifty men.

Tenth, Sistasoone: this nation numbers two hundred men, and reside at the head of the St.

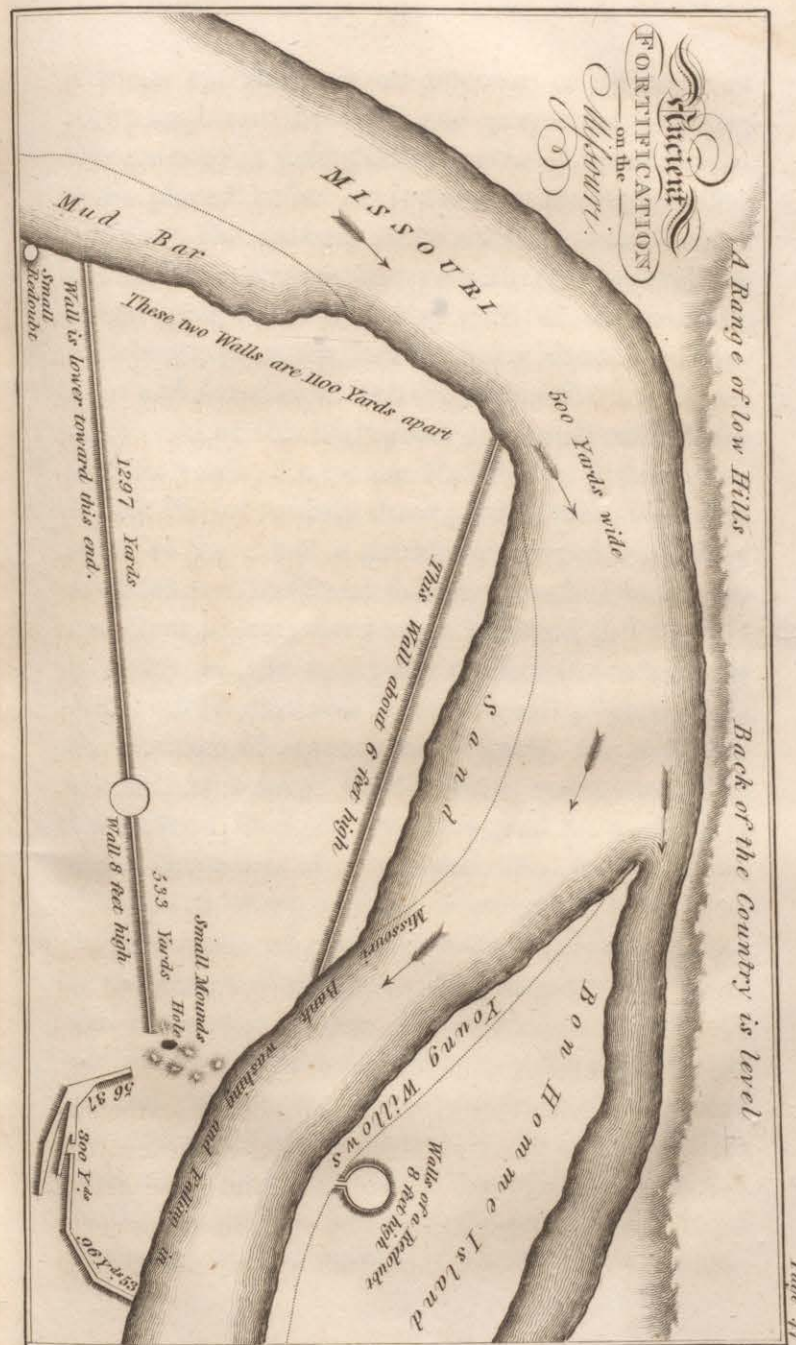

Peter's. Of these several tribes more particular notice will be taken hereafter.

Saturday, September 1, 1804. We proceeded this morning under a light southern breeze, and passed the Calumet bluffs; these are composed of a yellowish red, and brownish clay as hard as chalk, which it much resembles, and are one hundred and seventy, or one hundred and eighty feet high. At this place the hills on each side come to the verge of the river, those on the south being higher than on the north. Opposite the bluffs is a large island covered with timber; above which the highlands form a cliff over the river on the north side, called, White Bear Cliff; an animal of that kind being killed in one of the holes in it, which are numerous and apparently deep. At six miles we came to a large sand island covered with cottonwood; the wind was high, and the weather rainy and cloudy during the day. We made fifteen miles to a place on the north side, at the lower point of a large island called Bonhomme, or Goodman's island. The country on both sides has the same character of prairies, with no timber; with occasional lowlands covered with cottonwood, elm and oak: our hunters had killed an elk and a beaver: the catfish too are in great abundance.

September 2. It rained last night, and this morning we had a high wind from the N. W. We went three miles to the lower part of an ancient fortification on the south side, and passed the head

of Bonhomme island, which is large and well timbered: after this the wind became so violent, attended by a cold rain, that we were compelled to land at four miles on the northern side, under a high bluff of yellow clay, about one hundred and ten feet in height. Our hunters supplied us with four elks; and we had grapes and plums on the banks: we also saw the beargrass and rue, on the side of the bluffs. At this place there are highlands on both sides of the river, which become more level at some distance back, and contain but few streams of water. On the southern bank, during this day, the grounds have not been so elevated. Captain Clarke crossed the river to examine the remains of the fortification we had just passed.

This interesting object is on the south side of the Missouri, opposite the upper extremity of Bonhomme island, and in a low level plain, the hills being three miles from the river. It begins by a wall composed of earth, rising immediately from the bank of the river and running in a direct course S. 76° W. ninety-six yards; the base of this wall or mound is seventy-five feet, and its height about eight. It then diverges in a course S. 84° W. and continues at the same height and depth to the distance of fifty-three yards, the angle being formed by a sloping descent; at the junction of these two is an appearance of a hornwork, of the same height with the first angle: the same wall then pursues a course N. 69° W. for three hundred yards: near its

western extremity is an opening or gateway at right angles to the wall, and projecting inwards; this gateway is defended by two nearly semicircular walls placed before it, lower than the large walls; and from the gateway there seems to have been a covered way communicating with the interval between these two walls: westward of the gate, the wall becomes much larger, being about one hundred and five feet at its base, and twelve feet high: at the end of this high ground the wall extends for fifty-six yards on a course N. 32° W.; it then turns N. 23° W. for seventy-three yards: these two walls seem to have had a double or covered way; they are from ten to fifteen feet eight inches in height, and from seventy-five to one hundred and five feet in width at the base; the descent inwards being steep, whilst outwards it forms a sort of glacis. At the distance of seventy-three yards, the wall ends abruptly at a large hollow place much lower than the general level of the plain, and from which is some indication of a covered way to the water. The space between them is occupied by several mounds scattered promiscuously through the gorge, in the centre of which is a deep round hole. From the extremity of the last wall, in a course N. 32° W. is a distance of ninety-six yards over the low ground, where the wall recommences and crosses the plain in a course N. 81° W. for eighteen hundred and thirty yards to the bank of the Missouri. In this course its height is about eight feet, till it enters, at the distance of five hundred and thirty-

three yards, a deep circular pond of seventy-three yards diameter; after which it is gradually lower, towards the river: it touches the river at a muddy bar, which bears every mark of being an encroachment of the water, for a considerable distance; and a little above the junction, is a small circular redoubt. Along the bank of the river, and at eleven hundred yards distance, in a straight line from this wall, is a second, about six feet high, and of considerable width: it rises abruptly from the bank of the Missouri, at a point where the river bends, and goes straight forward, forming an acute angle with the last wall, till it enters the river again, not far from the mounds just described, towards which it is obviously tending. At the bend the Missouri is five hundred yards wide; the ground on the opposite side highlands, or low hills on the bank; and where the river passes between this fort and Bonhomme island, all the distance from the bend, it is constantly washing the banks into the stream, a large sandbank being already taken from the shore near the wall. During the whole course of this wall or glacis, it is covered with trees, among which are many large cotton trees, two or three feet in diameter. Immediately opposite the citadel, or the part most strongly fortified, on Bonhomme island, is a small work in a circular form, with a wall surrounding it, about six feet in height. The young willows along the water, joined to the general appearance of the two shores, induce a belief that the bank of the island is encroaching, and the Missouri indemnifies

itself by washing away the base of the fortification. The citadel contains about twenty acres, but the parts between the long walls must embrace nearly five hundred acres.

These are the first remains of the kind which we have had an opportunity of examining; but our French interpreters assure us, that there are great numbers of them on the Platte, the Kansas, the Jacques, &c. and some of our party say, that they observed two of those fortresses on the upper side of the Petit Arc creek, not far from its mouth; that the wall was about six feet high, and the sides of the angles one hundred yards in length.

September 3. The morning was cold, and the wind from the north-west. We passed at sunrise three large sandbars, and at the distance of ten miles reached a small creek, about twelve yards wide, coming in from the north, above a white bluff: this creek has obtained the name of Plum creek, from the number of that fruit which are in the neighbourhood, and of a delightful quality. Five miles further, we encamped on the south near the edge of a plain; the river is wide, and covered with sandbars to-day: the banks are high and of a whitish colour; the timber scarce, but an abundance of grapes. Beaver houses too have been observed in great numbers on the river, but none of the animals themselves.

September 4. We set out early, with a very cold wind from S. S. E., and at one mile and a half, reached a small creek, called Whitelime creek, on

the south side. Just above this is a cliff, covered with cedar trees, and at three miles a creek, called Whitepaint creek, of about thirty yards wide: on the same side, and at four and a half miles distance from the Whitepaint creek, is the rapid river, or, as it is called by the French, *la Riviere qui Court*; this river empties into the Missouri, in a course S. W. by W., and is one hundred and fifty-two yards wide, and four feet deep at the confluence. It rises in the Black mountains, and passes through a hilly country, with a poor soil. Captain Clarke ascended three miles to a beautiful plain, on the upper side, where the Pawnees once had a village: he found that the river widened above its mouth, and was much divided by sands and islands, which joined to the great rapidity of the current, makes the navigation very difficult, even for small boats. Like the Platte its waters were of a light colour; like that river too it throws out into the Missouri, great quantities of sand, coarser even than that of the Platte, which form sandbars and shoals near its mouth.

We encamped just above it, on the south, having made only eight miles, as the wind shifted to the south, and blew so hard that in the course of the day we broke our mast: we saw some deer, a number of geese, and shot a turkey and a duck: the place in which we halted is a fine low-ground, with much timber, such as red cedar, honeylocust, oak, arrowwood, elm, and coffeenut.

September 5, Wednesday. The wind was again

high from the south. At five miles, we came to a large island, called Pawnee island, in the middle of the river; and stopped to breakfast at a small creek on the north, which has the name of Goat creek, at eight and a half miles. Near the mouth of this creek the beaver had made a dam across so as to form a large pond, in which they built their houses. Above this island the river Poncara falls into the Missouri from the south, and is thirty yards wide at the entrance. Two men, whom we dispatched to the village of the same name, returned with information that they had found it on the lower side of the creek; but as this is the hunting season, the town was so completely deserted that they had killed a buffaloe in the village itself. This tribe of Poncaras, who are said to have once numbered four hundred men, are now reduced to about fifty, and have associated for mutual protection with the Mahas, who are about two hundred in number. These two nations are allied by a similarity of misfortune; they were once both numerous, both resided in villages, and cultivated Indian corn; their common enemies, the Sioux and small-pox, drove them from their towns, which they visit only occasionally for the purposes of trade; and they now wander over the plains on the sources of the Wolf and Quicurre rivers. Between the Pawnee island and Goat creek on the north, is a cliff of blue earth, under which are several mineral springs, impregnated with salts: near this we observed a number of goats, from

which the creek derives its name. At three and a half miles from the creek, we came to a large island on the south, along which we passed to the head of it, and encamped about four o'clock. Here we replaced the mast we had lost, with a new one of cedar: some bucks and an elk were procured to-day, and a black tailed deer was seen near the Poncara's village.

Thursday, September 6. There was a storm this morning from the N. W., and though it moderated, the wind was still high, and the weather very cold; the number of sandbars too, added to the rapidity of the current, obliged us to have recourse to the towline: with all our exertions we did not make more than eight and a half miles, and encamped on the north, after passing high cliffs of soft, blue, and red coloured stone, on the southern shore. We saw some goats, and great numbers of buffaloe, in addition to which the hunters furnished us with elk, deer, turkies, geese, and one beaver: a large catfish too was caught in the evening. The ground near the camp, was a low prairie, without timber, though just below is a grove of cottonwood.

Friday, September 7. The morning was very cold and the wind south-east. At five and a half miles, we reached and encamped at the foot of a round mountain, on the south, having passed two small islands. This mountain, which is about three hundred feet at the base, forms a cone at the top, resembling a dome at a distance, and seventy

feet or more above the surrounding highlands. As we descended from this dome, we arrived at a spot, on the gradual descent of the hill, nearly four acres in extent, and covered with small holes: these are the residence of a little animal, called by the French, *petit chien* (little dog) who sit erect near the mouth, and make a whistling noise, but when alarmed take refuge in their holes. In order to bring them out, we poured into one of the holes five barrels of water without filling it, but we dislodged and caught the owner. After digging down another of the holes for six feet, we found, on running a pole into it, that we had not yet dug half way to the bottom: we discovered, however, two frogs in the hole, and near it we killed a dark rattlesnake, which had swallowed a small prairie dog: we were also informed, though we never witnessed the fact, that a sort of lizard, and a snake, live habitually with these animals. The *petit chien* are justly named, as they resemble a small dog in some particulars, though they have also some points of similarity to the squirrel. The head resembles the squirrel in every respect, except that the ear is shorter, the tail like that of the ground-squirrel, the toe-nails are long, the fur is fine, and the long hair is gray.

Saturday, September 8. The wind still continued from the south-east, but moderately. At seven miles we reached a house on the north side, called the Pawnee house, where a trader named Trudeau, wintered in the year 1796-7: behind

this, hills, much higher than usual, appear to the north, about eight miles off. Before reaching this house, we came by three small islands, on the north side, and a small creek on the south; and after leaving it, reached another, at the end of seventeen miles, on which we encamped, and called it Boat island: we here saw herds of buffaloe, and some elk, deer, turkies, beaver, a squirrel, and a prairie dog. The party on the north represent the country through which they passed, as poor, rugged, and hilly, with the appearance of having been lately burnt by the Indians; the broken hills, indeed, approach the river on both sides, though each is bordered by a strip of woodland near the water.

Sunday, September 9. We coasted along the island on which we had encamped, and then passed three sand and willow islands, and a number of smaller sandbars. The river is shallow, and joined by two small creeks from the north, and one from the south. In the plains to the south, are great numbers of buffaloe, in herds of nearly five hundred; all the copses of timber appear to contain elk or deer. We encamped on a sandbar, on the southern shore, at the distance of fourteen and a quarter miles.

September 10, Monday. The next day we made twenty miles. The morning was cloudy and dark, but a light breeze from the south-east carried us past two small islands on the south, and one on the north; till at the distance of ten and a half miles, we reached an island extending for two miles in

the middle of the river, covered with red cedar, from which it derives its name of Cedar island. Just below this island, on a hill to the south, is the backbone of a fish forty-five feet long, tapering towards the tail, and in a perfect state of petrification, fragments of which were collected and sent to Washington. On both sides of the river are high dark-coloured bluffs. About a mile and a half from the island, on the southern shore, the party on that side discovered a large and very strongly impregnated spring of water; and another, not so strongly impregnated, half a mile up the hill. Three miles beyond Cedar island is a large island on the north, and a number of sandbars. After which is another about a mile in length, lying in the middle of the river, and separated by a small channel at its extremity, from another above it, on which we encamped. These two islands are called Mud islands. The river is shallow during this day's course, and is falling a little. The elk and buffaloe are in great abundance, but the deer have become scarce.

September 11, Tuesday. At six and a half miles we passed the upper extremity of an island on the south; four miles beyond which is another on the same side of the river; and about a quarter of a mile distant we visited a large village of the barking-squirrel. It was situated on a gentle declivity, and covered a space of nine hundred and seventy yards long, and eight hundred yards wide; we killed four of them. We then resumed our course, and during five and a half miles passed

two islands on the north, and then encamped at the distance of sixteen miles, on the south side of the river, and just above a small run. The morning had been cloudy, but in the afternoon it began raining, with a high north-west wind, which continued during the greater part of the night. The country seen to-day consists of narrow strips of lowland, rising into uneven grounds, which are succeeded, at the distance of three miles, by rich and level plains, but without any timber. The river itself is wide, and crowded with sandbars. Elk, deer, squirrels, a pelican, and a very large porcupine, were our game this day; some foxes too were seen, but not caught.

In the morning we observed a man riding on horseback down towards the boat, and we were much pleased to find that it was George Shannon, one of our party, for whose safety we had been very uneasy. Our two horses having strayed from us on the 26th of August, he was sent to search for them. After he had found them he attempted to rejoin us, but seeing some other tracks, which must have been those of Indians, and which he mistook for our own, he concluded that we were a-head, and had been for sixteen days following the bank of the river above us. During the first four days he exhausted his bullets, and was then nearly starved, being obliged to subsist for twelve days on a few grapes, and a rabbit which he killed by making use of a hard piece of stick for a ball. One of his horses gave out, and was left behind; the

other he kept as a last resource for food. Despairing of overtaking us, he was returning down the river in hopes of meeting some other boat; and was on the point of killing his horse, when he was so fortunate as to join us.

Wednesday, September 12. The day was dark and cloudy; the wind from the north-west. At a short distance we reached an island in the middle of the river, which is covered with timber, a rare object now. We with great difficulty were enabled to struggle through the sandbars, the water being very rapid and shallow, so that we were several hours in making a mile. Several times the boat wheeled on the bar, and the men were obliged to jump out and prevent her from upsetting; at others, after making a way up one channel, the shoalness of the water forced us back to seek the deep channel. We advanced only four miles in the whole day, and encamped on the south. Along both sides of the river are high grounds; on the southern side particularly, they form dark bluffs, in which may be observed slate and coal intermixed. We saw also several villages of barking-squirrels; great numbers of growse, and three foxes.

September 13, Thursday. We made twelve miles to-day through a number of sandbars, which make it difficult to find the proper channel. The hills on each side are high, and separated from the river by a narrow plain on its borders. On the north, these lowlands are covered in part with timber, and great quantities of grapes, which are now

ripe: on the south we found plenty of plums, but they are not yet ripe; and near the dark bluffs, a run tainted with alum and copperas; the southern side being more strongly impregnated with minerals than the northern. Last night four beavers were caught in the traps; a porcupine was shot as it was upon a cotton-tree, feeding on its leaves and branches. We encamped on the north side, opposite to a small willow island. At night the musquitoes were very troublesome, though the weather was cold and rainy, and the wind from the north-west.

Friday, September 14. At two miles we reached a round island on the northern side; at about five, a run on the south; two and a half miles further, a small creek; and at nine miles encamped near the mouth of a creek, on the same side. The sandbars are very numerous, and render the river wide and shallow, and obliged the crew to get into the water and drag the boat over the bars several times. During the whole day we searched along the southern shore, and at some distance into the interior, to find an ancient volcano which we heard at St. Charles was somewhere in this neighbourhood; but we could not discern the slightest appearance of any thing volcanic. In the course of their search the party shot a buck-goat and a hare. The hills, particularly on the south, continue high, but the timber is confined to the islands and banks of the river. We had occasion here to observe the rapid undermining of these hills by the Missouri:

the first attacks seem to be on the hills which overhang the river; as soon as the violence of the current destroys the grass at the foot of them, the whole texture appears loosened and the ground dissolves and mixes with the water: the muddy mixture is then forced over the low grounds, which it covers sometimes to the depth of three inches, and gradually destroys the herbage; after which it can offer no resistance to the water, and becomes at last covered with sand.

Saturday, September 15. We passed, at an early hour, the creek near our last night's encampment; and at two miles distance reached the mouth of White river, coming in from the south. We ascended a short distance, and sent a sergeant and another man to examine it higher up. This river has a bed of about three hundred yards, though the water is confined to one hundred and fifty: in the mouth are a sand island, and several sandbars. The current is regular and swift, with sandbars projecting from the points. It differs very much from the Platte, and Quicurre, in throwing out, comparatively, little sand, but its general character is like that of the Missouri. This resemblance was confirmed by the sergeant, who ascended about twelve miles; at this distance it was about the same width as near the mouth, and the course, which was generally west, had been interrupted by islands and sandbars. The timber consisted chiefly of elm; they saw pine burrs, and sticks of birch were seen floating down the river; they had also

met with goats, such as we have heretofore seen; great quantities of buffaloe, near to which were wolves, some deer, and villages of barking squirrels. At the confluence of White river with the Missouri, is an excellent position for a town; the land rising by three gradual ascents, and the neighbourhood furnishing more timber than is usual in this country. After passing high dark bluffs on both sides, we reached the lower point of an island towards the south, at the distance of six miles. The island bears an abundance of grapes, and is covered with red cedar; it also contains a number of rabbits. At the end of this island, which is small, a narrow channel separates it from a large sand island, which we passed, and encamped, eight miles on the north, under a high point of land opposite a large creek to the south, on which we observe an unusual quantity of timber. The wind was from the north-west this afternoon, and high. The weather cold, and its dreariness increased by the howlings of a number of wolves around us.

September 16, Sunday. Early this morning, having reached a convenient spot on the south side, and at one mile and a quarter distance, we encamped just above a small creek, which we called Corvus, having killed an animal of that genus near it. Finding that we could not proceed over the sandbars, as fast as we desired, while the boat was so heavily loaded, we concluded not to send back, as we originally intended, our third perioque, but to detain the soldiers until spring, and in the mean

time lighten the boat by loading the perioque: this operation, added to that of drying all our wet articles, detained us during the day. Our camp is in a beautiful plain, with timber thinly scattered for three quarters of a mile, and consisting chiefly of elm, cotton-wood, some ash of an indifferent quality, and a considerable quantity of a small species of white oak: this tree seldom rises higher than thirty feet, and branches very much; the bark is rough, thick, and of a light colour; the leaves small, deeply indented, and of a pale green; the cup which contains the acorn is fringed on the edges, and embraces it about one half: the acorn itself, which grows in great profusion, is of an excellent flavour, and has none of the roughness which most other acorns possess; they are now falling, and have probably attracted the number of deer which we saw on this place, as all the animals we have seen are fond of that food. The ground having been recently burnt by the Indians, is covered with young green grass, and in the neighbourhood are great quantities of fine plums. We killed a few deer for the sake of their skins, which we wanted to cover the perioques. the meat being too poor for food: the cold season coming on, a flannel shirt was given to each man, and fresh powder to those who had exhausted their supply.

Monday, September 16. Whilst some of the party were engaged in the same way as yesterday, others were employed in examining the surrounding country. About a quarter of a mile behind

our camp, and at an elevation of twenty feet above it, a plain extends nearly three miles parallel to the river, and about a mile back to the hills, towards which it gradually ascends. Here we saw a grove of plum trees loaded with fruit, now ripe, and differing in nothing from those of the Atlantic states, except that the tree is smaller and more thickly set. The ground of the plain is occupied by the burrows of multitudes of barking squirrels, who entice hither the wolves of a small kind, hawks, and polecats, all of which animals we saw, and presumed that they fed on the squirrel. This plain is intersected nearly in its whole extent by deep ravines and steep irregular rising grounds, from one to two hundred feet. On ascending the range of hills which border the plain, we saw a second high level plain stretching to the south, as far as the eye could reach. To the westward, a high range of hills about twenty miles distant runs nearly north and south, but not to any great extent, as their rise and termination is embraced by one view, and they seem covered with a verdure similar to that of the plains. The same view extended over the irregular hills which border the northern side of the Missouri: all around the country had been recently burnt, and a young green grass, about four inches high, covered the ground, which was enlivened by herds of antelopes and buffaloe; the last of which were in such multitudes, that we cannot exaggerate in saying, that at a single glance, we saw three thousand of them before us.

Of all the animals we had seen the antelope seems to possess the most wonderful fleetness: shy and timorous, they generally repose only on the ridges, which command a view of all the approaches of an enemy: the acuteness of their sight distinguishes the most distant danger, the delicate sensibility of their smell defeats the precautions of concealment, and when alarmed their rapid career seems more like the flight of birds than the movements of an earthly being. After many unsuccessful attempts, captain Lewis at last, by winding around the ridges, approached a party of seven, which were on an eminence, towards which the wind was unfortunately blowing. The only male of the party frequently encircled the summit of the hill, as if to announce any danger to the females, who formed a group at the top. Although they did not see captain Lewis, the smell alarmed them, and they fled when he was at the distance of two hundred yards: he immediately ran to the spot where they had been, a ravine concealed them from him, but the next moment they appeared on a second ridge, at the distance of three miles. He doubted whether it could be the same, but their number and the extreme rapidity with which they continued their course, convinced him that they must have gone with a speed equal to that of the most distinguished racehorse. Among our acquisitions to-day was a mule-deer, a magpie, the common deer, and buffaloe: captain Lewis also saw a

hare, and killed a rattlesnake near the burrows of the barking squirrels.

Tuesday, September 18. Having every thing in readiness we proceeded, with the boat much lightened, but the wind being from the N. W. we made but little way. At one mile we reached an island in the middle of the river, nearly a mile in length, and covered with red cedar; at its extremity a small creek comes in from the north; we then met some sandbars, and the wind being very high and a-head, we encamped on the south, having made only seven miles. In addition to the common deer, which were in great abundance, we saw goats, elk, buffaloe, the black tailed deer; the large wolves too are very numerous, and have long hair with coarse fur, and are of a light colour. A small species of wolf, about the size of a grey fox, was also killed, and proved to be the animal which we had hitherto mistaken for a fox; there are also many porcupines, rabbits, and barking squirrels in the neighbourhood.

September 19. We this day enjoyed a cool clear morning, and a wind from the south-east. We reached at three miles a bluff on the south, and four miles further, the lower point of Prospect island, about two and a half miles in length; opposite to this are high bluffs, about eighty feet above the water, beyond which are beautiful plains, gradually rising as they recede from the river; these are watered by three streams which empty

near each other: the first is about thirty-five yards wide, the ground on its sides high and rich, with some timber; the second about twelve yards wide, but with less timber; the third is nearly of the same size, and contains more water, but it scatters its waters over the large timbered plain, and empties itself into the river at three places. These rivers are called by the French *Les trois rivières des Sioux*, the three Sioux rivers: and as the Sioux generally cross the Missouri at this place, it is called the Sioux pass of the three rivers. These streams have the same right of asylum, though in a less degree, than Pipestone creek already mentioned.

Two miles from the island we passed a creek fifteen yards wide; eight miles further, another twenty yards wide; three miles beyond which is a third of eighteen yards width, all on the south side: the second, which passes through a high plain, we called Elm creek; to the third we gave the name of Night creek, having reached it late at night. About a mile beyond this is a small island on the north side of the river, and is called Lower island, as it is situated at the commencement of what is known by the name of the Grand Detour, or Great Bend of the Missouri. Opposite is a creek on the south, about ten yards wide, which waters a plain where there are great numbers of the prickly pear, which name we gave to the creek. We encamped on the south, opposite the upper extremity of the island, having made an excellent day's sail of twenty-six and a quarter miles. Our game this day

consisted chiefly of deer; of these four were black tails, one a buck with two main prongs of horns on each side, and forked equally. Large herds of buffaloe, elk, and goats, were also seen.

Thursday, September 20. Finding we had reached the Big Bend, we dispatched two men with our only horse across the neck, to hunt there and wait our arrival at the first creek beyond it. We then set out with fair weather and the wind from S. E. to make the circuit of the bend. Near the lower island the sandbars are numerous, and the river shallow. At nine and a half miles is a sand island, on the southern side. About ten miles beyond it is a small island on the south, opposite to a small creek on the north. This island, which is near the N. W. extremity of the bend, is called Solitary island. At about eleven miles further, we encamped on a sandbar, having made twenty-seven and a half miles. Captain Clarke, who early this morning had crossed the neck of the bend, joined us in the evening. At the narrowest part, the gorge is composed of high and irregular hills of about one hundred and eighty, or one hundred and ninety feet in elevation; from this descends an unbroken plain over the whole bend, and the country is separated from it by this ridge. Great numbers of buffaloe, elk, and goats are wandering over these plains, accompanied by grouse and larks. Captain Clarke saw a hare also, on the Great Bend. Of the goats killed to-day, one is a female differing from the male in being smaller in size; its

horns too are smaller and straighter, having one short prong, and no black about the neck; none of these goats have any beard, but are delicately formed, and very beautiful.

Friday, September 21. Between one and two o'clock the sergeant on guard alarmed us, by crying, that the sandbar on which we lay was sinking; we jumped up, and found that both above and below our camp the sand was undermined and falling in very fast: we had scarcely got into the boats and pushed off, when the bank under which they had been lying, fell in, and would certainly have sunk the two perioques if they had remained there. By the time we reached the opposite shore the ground of our encampment sunk also. We formed a second camp for the rest of the night, and at daylight proceeded on to the gorge or throat of the Great Bend, where we breakfasted. A man, whom we had dispatched to step off the distance across the bend, made it two thousand yards; the circuit is thirty miles. During the whole course, the land of the bend is low, with occasional bluffs; that on the opposite side, high prairie ground, and longridges of dark bluffs. After breakfast, we passed through a high prairie on the north side, and a rich cedar lowland and cedar bluff on the south, till we reached a willow island below the mouth of a small creek. This creek, called Tyler's river, is about thirty-five yards wide, comes in on the south, and is at the distance of six miles from the neck of the Great Bend. Here we found a deer, and the skin of a

white wolf, left us by our hunters a-head: large quantities of different kinds of plover and brants are in this neighbourhood, and seen collecting and moving towards the south: the catfish are small, and not in such plenty as we had found them below this place. We passed several sandbars, which make the river very shallow and about a mile in width, and encamped on the south, at the distance of eleven and a half miles. On each side the shore is lined with hard rough gulleystones, rolled from the hills and small brooks. The most common timber is the cedar, though, in the prairies, there are great quantities of the prickly pear. At the distance of eleven and a half miles, we encamped on the north at the lower point of an ancient island, which has since been connected with the main land by the filling up of the northern channel, and is now covered with cottonwood. We here saw some tracks of Indians, but they appeared three or four weeks old. This day was warm.

September 22. A thick fog detained us until seven o'clock; our course was through inclined prairies on each side of the river, crowded with buffaloe. We halted at a point on the north side, near a high bluff on the south, and took a meridian altitude, which gave us the latitude of $44^{\circ} 11' 33\frac{3}{4}''$. On renewing our course, we reached first a small island on the south, at the distance of four and a half miles, immediately above which is another island opposite to a creek fifteen yards wide. This creek, and the two islands, one of which is half a mile long

and the second three miles, are called the Three Sisters: a beautiful plain extending on both sides of the river. This is followed by an island on the north, called Cedar island, about one mile and a half in length, and the same distance in breadth, and deriving its name from the quality of the timber. On the south side of this island, is a fort and a large trading house, built by a Mr. Loisel, who wintered here during the last year, in order to trade with the Sioux, the remains of whose camps are in great numbers about this place. The establishment is sixty or seventy feet square, built with red cedar and picketted in with the same materials. The hunters who had been sent a-head joined us here. They mention that the hills are washed in gullies, in passing over which, some mineral substances had rotted and destroyed their moccasins; they had killed two deer and a beaver. At sixteen miles distance we came to on the north side at the mouth of a small creek. The large stones which we saw yesterday on the shores are now some distance in the river, and render the navigation dangerous. The musquitoes are still numerous in the low grounds.

Sunday, September 23. We passed, with a light breeze from the south-east, a small island on the north, called Goat island; above which is a small creek, called by the party Smoke creek, as we observed a great smoke to the south-west on approaching it. At ten miles we came to the lower point of a large island, having passed two small

willow islands with sandbars projecting from them. This island, which we call Elk island, is about two and a half miles long, and three quarters of a mile wide, situated near the south, and covered with cottonwood, the red currant, and grapes. The river is here almost straight for a considerable distance, wide and shallow, with many sand-bars. A small creek on the north, about sixteen yards wide, we called Reuben's creek; as Reuben Fields, one of our men, was the first of the party who reached it. At a short distance above this we encamped for the night, having made twenty miles. The country, generally, consists of low, rich, timbered ground on the north, and high barren lands on the south: on both sides great numbers of buffaloe are feeding. In the evening three boys of the Sioux nation swam across the river, and informed us that two parties of Sioux were encamped on the next river, one consisting of eighty, and the second of sixty lodgers, at some distance above. After treating them kindly we sent them back, with a present of two carrots of tobacco to their chiefs, whom we invited to a conference in the morning.

Monday, September 24. The wind was from the east, and the day fair; we soon passed a handsome prairie on the north side, covered with ripe plums, and the mouth of a creek on the south, called Highwater creek, a little above our encampment. At about five miles we reached an island two and a half miles in length, and situated near the south,

Here we were joined by one of our hunters, who procured four elk, but whilst he was in pursuit of the game the Indians had stolen his horse. We left the island, and soon overtook five Indians on the shore: we anchored, and told them from the boat we were friends and wished to continue so, but were not afraid of any Indians; that some of their young men had stolen the horse which their great father had sent for their great chief, and that we could not treat with them until he was restored. They said that they knew nothing of the horse, but if he had been taken he should be given up. We went on, and at eleven and a half miles, passed an island on the north, which we called Good-humoured island; it is about one and a half miles long, and abounds in elk. At thirteen and a half miles, we anchored one hundred yards off the mouth of a river on the south side, where we were joined by both the perioques and encamped; two-thirds of the party remained on board, and the rest went as a guard on shore with the cooks and one perioque; we have seen along the sides of the hills on the north a great deal of stone; besides the elk, we also observed a hare; the five Indians whom we had seen followed us, and slept with the guard on shore. Finding one of them was a chief we smoked with him, and made him a present of tobacco. This river is about seventy yards wide, and has a considerable current. As the tribe of the Sioux which inhabit it are called Teton, we gave it the name of Teton river.

CHAPTER IV.

COUNCIL HELD WITH THE TETONS — THEIR MANNERS, DANCES, &c. — CHAYENNE RIVER — COUNCIL HELD WITH THE RICARA INDIANS — THEIR MANNERS AND HABITS — STRANGE INSTANCE OF RICARA IDOLATRY — ANOTHER INSTANCE — CANNONBALL RIVER — ARRIVAL AMONG THE MANDANS — CHARACTER OF THE SURROUNDING COUNTRY, AND OF THE CREEKS, ISLANDS, &c.

SEPTEMBER 25. The morning was fine, and the wind continued from the south-east. We raised a flagstaff and an awning, under which we assembled at twelve o'clock, with all the party parading under arms. The chiefs and warriors from the camp two miles up the river, met us, about fifty or sixty in number, and after smoking delivered them a speech; but as our Sioux interpreter, Mr. Durion, had been left with the Yanktons, we were obliged to make use of a Frenchman, who could not speak fluently, and therefore we curtailed our harangue. After this we went through the ceremony of acknowledging the chiefs, by giving to the grand chief a medal, a flag of the United States, a laced uniform coat, a cocked hat and feather: to the two other chiefs a medal and some small presents; and to two warriors of consideration certificates. The

name of the great chief is Untongasabaw, or Black Buffalo; the second Tortohonga, or the Partisan; the third Tartongawaka, or Buffalo Medicine: the name of one of the warriors was Wawzinggo; that of the second Matocoquepa, or Second Bear. We then invited the chiefs on board, and showed them the boat, the airgun, and such curiosities as we thought might amuse them: in this we succeeded too well; for after giving them a quarter of a glass of whiskey, which they seemed to like very much, and sucked the bottle, it was with much difficulty that we could get rid of them. They at last accompanied Captain Clarke on shore in a perioque with five men; but it seems they had formed a design to stop us; for no sooner had the party landed than three of the Indians seized the cable of the perioque, and one of the soldiers of the chief put his arm round the mast: the second chief who affected intoxication, then said, that we should not go on, that they had not received presents enough from us: Captain Clarke told him that he would not be prevented from going on; that we were not squaws, but warriors; that we were sent by our great father, who could in a moment exterminate them: the chief replied, that he too had warriors, and was proceeding to offer personal violence to Captain Clarke, who immediately drew his sword, and made a signal to the boat to prepare for action. The Indians who surrounded him, drew their arrows from their quivers and were bending their bows, when the swivel in the boat was in-

stantly pointed towards them, and twelve of our most determined men jumped into the perioque and joined Captain Clarke. This movement made an impression on them, for the grand chief ordered the young men away from the perioque, and they withdrew and held a short council with the warriors. Being unwilling to irritate them, Captain Clarke then went forward and offered his hand to the first and second chiefs, who refused to take it. He then turned from them and got into the perioque, but had not gone more than ten paces when both the chiefs and two of the warriors waded in after him, and he brought them on board. We then proceeded on for a mile and anchored off a willow island, which from the circumstances which had just occurred we called Badhumoured island.

Wednesday, September 26. Our conduct yesterday seemed to have inspired the Indians with fear of us, and as we were desirous of cultivating their acquaintance, we complied with their wish that we should give them an opportunity of treating us well, and also suffer their squaws and children to see us and our boat, which would be perfectly new to them. Accordingly, after passing at one and a half mile a small willow island and several sandbars, we came to on the south side, where a crowd of men, women, and children were waiting to receive us. Captain Lewis went on shore and remained several hours, and observing that their disposition was friendly we resolved to remain during the night to a dance, which they were preparing for us. Captains Lewis

and Clarke, who went on shore one after the other, were met on landing by ten well dressed young men, who took them up in a robe highly decorated and carried them to a large council house, where they were placed on a dressed buffalo skin by the side of the grand chief. The hall or council-room was in the shape of three quarters of a circle, covered at the top and sides with skins well dressed and sewed together. Under this shelter sat about seventy men, forming a circle round the chief, before whom were placed a Spanish flag and the one we had given them yesterday. This left a vacant circle of about six feet diameter, in which the pipe of peace was raised on two forked sticks, about six or eight inches from the ground, and under it the down of the swan was scattered: a large fire, in which they were cooking provisions, stood near, and in the centre about four hundred pounds of excellent Buffalo meat as a present for us. As soon as we were seated, an old man got up, and after approving what we had done, begged us to take pity on their unfortunate situation. To this we replied with assurances of protection. After he had ceased, the great chief rose and delivered a harangue to the same effect: then with great solemnity he took some of the most delicate parts of the dog, which was cooked for the festival, and held it to the flag by way of sacrifice: this done, he held up the pipe of peace, and first pointed it towards the heavens, then to the four quarters of the globe, and then to the earth, made

a short speech, lighted the pipe, and presented it to us. We smoaked, and he again harangued his people, after which the repast was served up to us. It consisted of the dog which they had just been cooking, this being a great dish among the Sioux, and used on all festivals; to this were added, pemitigon, a dish made of buffaloe meat, dried or jerked, and then pounded and mixed raw with grease, and a kind of ground potatoe, dressed like the preparation of Indian corn called hominy, to which it is little inferior. Of all these luxuries which were placed before us in platters with horn spoons, we took the pemitigon and the potatoe, which we found good, but we could as yet partake but sparingly of the dog. We ate and smoaked for an hour, when it became dark: every thing was then cleared away for the dance, a large fire being made in the centre of the house, giving at once light and warmth to the ball-room. The orchestra was composed of about ten men, who played on a sort of tambourin, formed of skin stretched across a hoop; and made a jingling noise with a long stick, to which the hoofs of deer and goats were hung; the third instrument was a small skin bag with pebbles in it: these, with five or six young men for the vocal part, made up the band. The women then came forward highly decorated; some with poles in their hands, on which were hung the scalps of their enemies; others with guns, spears, or different trophies, taken in war by their husbands, brothers, or connections. Having ar-

ranged themselves in two columns, one on each side of the fire, as soon as the music began they danced towards each other till they met in the centre, when the rattles were shaken, and they all shouted and returned back to their places. They have no step, but shuffle along the ground; nor does the music appear to be any thing more than a confusion of noises, distinguished only by hard or gentle blows upon the buffaloe skin: the song is perfectly extemporaneous. In the pauses of the dance any man of the company comes forward and recites, in a sort of low guttural tone, some little story or incident, which is either martial or ludicrous; or, as was the case this evening, voluptuous and indecent; this is taken up by the orchestra and the dancers, who repeat it in a higher strain and dance to it. Sometimes they alternate; the orchestra first performing, and when it ceases, the women raise their voices, and make a music more agreeable, that is, less intolerable than that of the musicians. The dances of the men, which are always separate from the women, are conducted very nearly in the same way, except that the men jump up and down instead of shuffling; and in the war dances the recitations are of a military cast. The harmony of the entertainment had nearly been disturbed by one of the musicians, who thinking he had not received a due share of the tobacco we had distributed during the evening, put himself into a passion, broke one of the drums, threw two of them into the fire and left the band. They

were taken out of the fire: a buffaloe robe held in one hand and beaten with the other, by several of the company, supplied the place of the lost drum or tambourin, and no notice was taken of the offensive conduct of the man. We staid till twelve o'clock at night, when we informed the chiefs, that they must be fatigued with all these attempts to amuse us, and retired, accompanied by four chiefs, two of whom spent the night with us on board.

While on shore we saw twenty-five squaws, and about the same number of children, who had been taken prisoners two weeks ago, in a battle with their countrymen the Mahas. In this engagement the Sioux destroyed forty lodges, killed seventy-five men, of which we saw many of the scalps, and took these prisoners; their appearance is wretched and dejected; the women too seem low in stature, coarse and ugly; though their present condition may diminish their beauty. We gave them a variety of small articles, such as awls and needles, and interceded for them with the chiefs, to whom we recommended to follow the advice of their great father, to restore the prisoners and live in peace with the Mahas, which they promised to do.

The tribe which we this day saw, are a part of the great Sioux nation, and are known by the name of the Teton Okandandas: they are about two hundred men in number, and their chief residence is on both sides of the Missouri, between the Chayenne and Teton rivers. In their persons

they are rather ugly and ill made, their legs and arms being too small, their cheek-bones high, and their eyes projecting. The females, with the same character of form, are more handsome; and both sexes appear cheerful and sprightly; but in our intercourse with them, we discovered that they were cunning and vicious.

The men shave the hair off their heads, except a small tuft on the top, which they suffer to grow and wear in plaits over the shoulders; to this they seem much attached, as the loss of it is the usual sacrifice at the death of near relations. In full dress, the men of consideration wear a hawk's feather, or calumet feather worked with porcupine quills, and fastened to the top of the head, from which it falls back. The face and body are generally painted with a mixture of grease and coal. Over the shoulders is a loose robe or mantle of buffaloe skin dressed white, adorned with porcupine quills loosely fixed so as to make a jingling noise when in motion, and painted with various uncouth figures unintelligible to us, but to them emblematic of military exploits, or any other incident; the hair of the robe is worn next the skin in fair weather, but when it rains the hair is put outside, and the robe is either thrown over the arm, or wrapped round the body, all of which it may cover. Under this, in the winter season, they wear a kind of shirt resembling ours, and made either of skin or cloth, and covering the arms and body. Round the middle is fixed a girdle of cloth or procured

dressed elk-skin, about an inch in width, and closely tied to the body, to this is attached a piece of cloth or blanket, or skin about a foot wide, which passes between the legs and is tucked under the girdle both before and behind; from the hip to the ankle he is covered by leggings of dressed antelope skins, with seams at the sides two inches in width, and ornamented by little tufts of hair, the produce of the scalps they have made in war, which are scattered down the leg. The winter moccasins are of dressed buffaloe skin, the hair being worn inwards, and soled with thick elk-skin parchment; those for summer are of deer or elk-skin, dressed without the hair, and with soles of elk-skin. On great occasions, or whenever they are in full dress, the young men drag after them the entire skin of a polecat fixed to the heel of the moccasin. Another skin of the same animal is either tucked into the girdle or carried in the hand, and serves as a pouch for their tobacco, or what the French traders call the *bois roule*: this is the inner bark of a species of red willow, which being dried in the sun or over the fire, is rubbed between the hands and broken into small pieces, and is used alone or mixed with tobacco. The pipe is generally of red earth, the stem made of ash, about three or four feet long, and highly decorated with feathers, hair, and porcupine quills.

The hair of the women is suffered to grow long, and is parted from the forehead across the head, at the back of which it is either collected into a

kind of bag, or hangs down over the shoulders. Their moccasins are like those of the men, as are also the leggings, which do not however reach beyond the knee, where it is met by a long loose shift of skin which reaches nearly to the ankles: this is fastened over the shoulders by a string and has no sleeves, but a few pieces of the skin hang a short distance down the arm. Sometimes a girdle fastens this skin round the waist, and over all is thrown a robe like that worn by the men. They seem fond of dress. Their lodges are very neatly constructed, in the same form as those of the Yanktons; they consist of about one hundred cabins, made of white buffaloe hide dressed, with a larger one in the centre for holding councils and dances. They are built round with poles about fifteen or twenty feet high, covered with white skins; these lodges may be taken to pieces, packed up, and carried with the nation wherever they go, by dogs which bear great burdens. The women are chiefly employed in dressing buffaloe skins: they seem perfectly well disposed, but are addicted to stealing any thing which they can take without being observed. This nation, although it makes so many ravages among its neighbours, is badly supplied with guns. The water which they carry with them is contained chiefly in the paunches of deer and other animals, and they make use of wooden bowls. Some had their heads shaved, which we found was a species of mourning for relations. Another usage, on these occasions, is

to run arrows through the flesh both above and below the elbow.

While on shore to-day we witnessed a quarrel between two squaws, which appeared to be growing every moment more boisterous, when a man came forward, at whose approach every one seemed terrified and ran. He took the squaws, and without any ceremony whipped them severely; on inquiring into the nature of such summary justice, we learnt that this man was an officer well known to this and many other tribes. His duty is to keep the peace, and the whole interior police of the village is confided to two or three of these officers, who are named by the chief and remain in power some days, at least till the chief appoints a successor; they seem to be a sort of constable or sentinel, since they are always on the watch to keep tranquillity during the day, and guarding the camp in the night. The short duration of their office is compensated by its authority: his power is supreme, and in the suppression of any riot or disturbance no resistance to him is suffered: his power is sacred, and if in the execution of his duty he strikes even a chief of the second class, he cannot be punished for this salutary insolence. In general they accompany the person of the chief, and when ordered to any duty, however dangerous, it is a point of honour rather to die than to refuse obedience. Thus, when they attempted to stop us yesterday, the chief ordered one of these men to take possession of the boat; he immediately put

his arms round the mast, and, as we understood, no force except the command of the chief would have induced him to release his hold. Like the other men their bodies are blackened, but their distinguishing mark is a collection of two or three raven skins fixed to the girdle behind the back in such a way, that the tails stick out horizontally from the body. On his head too is a raven skin split into two parts, and tied so as to let the beak project from the forehead.

Thursday, September 27. We rose early, and the two chiefs took off, as a matter of course and according to their custom, the blanket on which they had slept. To this we added a peck of corn as a present to each. Captain Lewis and the chiefs went on shore to see a part of the nation that was expected, but did not come. He returned at two o'clock, with four of the chiefs and a warrior of distinction, called Wadraba, (or on his guard); they examined the boat and admired whatever was strange, during half an hour, when they left it with great reluctance. Captain Clarke accompanied them to the lodge of the grand chief, who invited them to a dance, where, being joined by Captain Lewis, they remained till a late hour. The dance was very similar to that of yesterday. About twelve we left them, taking the second chief and one principal warrior on board: as we came near the boat the man who steered the perioque, by mistake, brought her broadside against the boat's cable, and broke it. We called up all hands to their oars;

but our noise alarmed the two Indians: they called out to their companions, and immediately the whole camp crowded to the shore; but after half an hour they returned, leaving about sixty men near us. The alarm given by the chiefs was said to be that the Mahas had attacked us, and that they were desirous of assisting us to repel them; but we suspected that they were afraid we meant to set sail, and intended to prevent us from doing so; for in the night the Maha prisoners had told one of our men, who understood the language, that we were to be stopped. We therefore, without giving any indication of our suspicion, prepared every thing for an attack, as the loss of our anchor obliged us to come to near a falling bank, very unfavourable for defence. We were not mistaken in these opinions; for when in the morning,

Friday, September 28, after dragging unsuccessfully for the anchor, we wished to set sail, it was with great difficulty that we could make the chiefs leave the boat. At length we got rid of all except the great chief; when just as we were setting out, several of the chief's soldiers sat on the rope which held the boat on the shore. Irritated at this we got every thing ready to fire on them if they persisted, but the great chief said that these were his soldiers and only wanted some tobacco. We had already refused a flag and some tobacco to the second chief, who had demanded it with great importunity; but willing to leave them without going to extremities, we threw him a carrot of tobacco,

saying to him, "You have told us that you were a great man, and have influence; now show your influence, by taking the rope from those men, and we will then go without any further trouble." This appeal to his pride had the desired effect; he went out of the boat, gave the soldiers the tobacco, and pulling the rope out of their hands delivered it on board, and we then set sail under a breeze from the S. E. After sailing about two miles we observed the third chief beckoning to us: we took him on board, and he informed us that the rope had been held by the order of the second chief, who was a double-faced man. A little farther on we were joined by the son of the chief, who came on board to see his father. On his return we sent a speech to the nation, explaining what we had done, and advising them to peace; but if they persisted in their attempts to stop us, we were willing and able to defend ourselves. After making six miles, during which we passed a willow island on the south and one sandbar, we encamped on another in the middle of the river. The country on the south side was a low prairie, that on the north highland.

September 29. We set out early, but were again impeded by sandbars, which made the river shallow; the weather was however fair: the land on the north side low and covered with timber, contrasted with the bluffs to the south. At nine o'clock we saw the second chief and two women and three men on shore, who wished us to take two women offered by the second chief to make

friends, which was refused; he then requested us to take them to the other band of their nation, who were on the river not far from us: this we declined; but in spite of our wishes they followed us along shore. The chief asked us to give them some tobacco; this we did, and gave more as a present for that part of the nation which we did not see. At seven and a half miles we came to a small creek, on the southern side, where we saw great numbers of elk, and which we called Notimber creek from its bare appearance. Above the mouth of this stream, a Ricara band of Pawnees had a village five years ago: but there are no remains of it except the mound which encircled the town. Here the second chief went on shore. We then proceeded, and at the distance of eleven miles encamped on the lower part of a willow island, in the middle of the river, being obliged to substitute large stones, in the place of the anchor which we lost.

September 30. The wind was this morning very high from the south-east, so that we were obliged to proceed under a double-reefed mainsail, through the rain. The country presented a large low prairie covered with timber on the north side; on the south, we first had high barren hills, but after some miles it became of the same character as that on the opposite side. We had not gone far when an Indian ran after us, and begged to be carried on board as far as the Ricaras, which we refused: soon after, we discovered on the hills at a distance, a great number of Indians, who came towards the

river and encamped a-head of us. We stopped at a sandbar, at about eleven miles, and after breakfasting proceeded on a short distance to their camp, which consisted of about four hundred souls. We anchored one hundred yards from the shore, and discovering that they were Tetons belonging to the band which we had just left, we told them that we took them by the hand, and would make each chief a present of tobacco; that we had been badly treated by some of their band, and that having waited for them two days below, we could not stop here, but referred them to Mr. Durion for our talk and an explanation of our views: they then apologized for what had past, assured us that they were friendly, and very desirous that we should land and eat with them: this we refused, but sent the perioque on shore with the tobacco, which was delivered to one of the soldiers of the chief, whom we had on board. Several of them now ran along the shore after us, but the chief threw them a twist of tobacco, and told them to go back and open their ears to our councils; on which they immediately returned to their lodges. We then proceeded past a continuation of the low prairie on the north, where we had large quantities of grapes, and on the south saw a small creek and an island. Six miles above this, two Indians came to the bank, looked at us about half an hour, and then went without speaking over the hills to the south-west. After some time the wind rose still higher, and the boat struck a log, turned, and was very near taking in water. The

chief became so much terrified at the danger, that he hid himself in the boat, and as soon as we landed got his gun and told us that he wanted to return, that we would now see no more Tetons, and that we might proceed unmolested: we repeated the advice we had already given, presented him with a blanket, a knife, some tobacco, and after smoking with him he set out. We then continued to a sandbar on the north side, where we encamped, having come twenty and a half miles. In the course of the day we saw a number of sandbars which impede the navigation. The only animal which we observed was the white gull, then in great abundance.

October 1st, 1804. The weather was very cold and the wind high from the south-east during the night, and continued so this morning. At three miles distance, we had passed a large island in the middle of the river, opposite to the lower end of which the Ricaras once had a village on the south side of the river: there are, however, no remnants of it now, except a circular wall three or four feet in height, which encompassed the town. Two miles beyond this island is a river coming in from the south-west, about four hundred yards wide; the current gentle, and discharging not much water, and very little sand: it takes its rise in the second range of the Cote Noire or Black mountains, and its general course is nearly east; this river has been occasionally called Dog river, under a mistaken opinion that its French name was Chien, but its true appellation is Chayenne, and it derives this

title from the Chayenne Indians: their history is the short and melancholy relation of the calamities of almost all the Indians. They were a numerous people and lived on the Chayenne, a branch of the Red river of Lake Winnipeg. The invasion of the Sioux drove them westward; in their progress they halted on the southern side of the Missouri below the Warreconne, where their ancient fortifications still exist; but the same impulse again drove them to the heads of the Chayenne, where they now rove, and occasionally visit the Ricaras. They are now reduced, but still number three hundred men.

Although the river did not seem to throw out much sand, yet near and above its mouth we find a great many sandbars difficult to pass. On both sides of the Missouri, near the Chayenne, are rich thinly timbered lowlands, behind which are bare hills. As we proceeded, we found that the sandbars made the river so shallow, and the wind was so high, that we could scarcely find the channel, and at one place we were forced to drag the boat over a sandbar, the Missouri being very wide and falling a little. At seven and a half miles we came to a point, and remained three hours, during which time the wind abated: we then passed within four miles, two creeks on the south, one of which we called Centinel creek, and the other Look-out creek. This part of the river has but little timber; the hills are not so high as we have hitherto seen, and the number of sandbars extends the river to more than half

a mile in breadth. We continued about four and a half miles further, to a sandbar in the middle of the river, where we spent the night, our progress being sixteen miles. On the opposite shore, we saw a house among the willows, and a boy, to whom we called, and brought him on board. He proved to be a young Frenchman in the employ of a Mr. Valle, a trader, who is now here pursuing his commerce with the Sioux.

Tuesday, October 2. There had been a violent wind from the S. E. during the night, which having moderated, we set sail with Mr. Valle, who visited us this morning and accompanied us for two miles. He is one of three French traders who have halted here, expecting the Sioux who are coming down from the Ricaras, where they now are, for the purposes of traffic. Mr. Valle tells us that he passed the last winter three hundred leagues up the Chayenne, under the Black mountains. That river he represents as very rapid, liable to sudden swells, the bed and shores formed of coarse gravel, and difficult of ascent even for canoes. One hundred leagues from its mouth it divides into two branches, one coming from the south, the other at forty leagues from the junction enters the Black mountains. The land which it waters from the Missouri to the Black mountains, resembles the country on the Missouri, except that the former has even less timber, and of that the greater proportion is cedar. The Chayennes reside chiefly on the heads of the river, and steal horses from the Spanish settlement, a plunder-

ing excursion which they perform in a month's time. The Black mountains, he observes, are very high, covered with great quantities of pine, and in some parts the snow remains during the summer. There are also great quantities of goats, white bears, prairie cocks, and a species of animal which, from his description, must resemble a small elk, with large circular horns.

At two and a half miles we had passed a willow island on the south, on the north side of the river were dark bluffs, and on the south low rich prairies. We took a meridian altitude on our arrival at the upper end of the isthmus of the bend, which we called the Look-out bend, and found the latitude to be $44^{\circ} 19' 36''$. This bend is nearly twenty miles round, and not more than two miles across.

In the afternoon we heard a shot fired, and not long after observed some Indians on a hill: one of them came to the shore and wished us to land, as there were twenty lodges of Yanktons or Boisbrule there; we declined doing so, telling him that we had already seen his chiefs, and that they might learn from Mr. Durion the nature of the talk we had delivered to them. At nine miles we came to the lower point of a long island on the north, the banks of the south side of the river being high, those of the north forming a low rich prairie. We coasted along this island, which we called Caution island, and after passing a small creek on the south, encamped on a sandbar in the middle of the river, having made twelve miles. The wind changed

to the north-west, and became very high and cold. The current of the river is less rapid, and the water, though of the same colour, contains less sediment than below the Chayenne, but its width continues the same. We were not able to hunt to-day; for as there are so many Indians in the neighbourhood, we were in constant expectation of being attacked, and were therefore forced to keep the party together and be on our guard.

Wednesday, October 3. The wind continued so high from the north-west, that we could not set out till after seven: we then proceeded till twelve o'clock, and landed on a bar towards the south, where we examined the perioques, and the fore-castle of the boat, and found that the mice had cut several bags of corn, and spoiled some of our clothes: about one o'clock an Indian came running to the shore with a turkey on his back: several others soon joined him, but we had no intercourse with them. We then went on for three miles, but the ascent soon became so obstructed by sandbars and shoal water, that after attempting in vain several channels, we determined to rest for the night under some high bluffs on the south, and send out to examine the best channel. We had made eight miles along high bluffs on each side. The birds we saw were the white gulls and the brant, which were flying to the southward in large flocks.

Thursday, 4th. On examination we found that there was no outlet practicable for us in this chan-

nel, and that we must retread our steps. We therefore returned three miles, and attempted another channel, in which we were more fortunate. The Indians were in small numbers on the shore, and seemed willing, had they been more numerous, to molest us. They called to desire that we would land, and one of them gave three yells and fired a ball a-head of the boat: we however took no notice of it, but landed on the south to breakfast. One of these Indians swam across and begged for some powder; we gave him a piece of tobacco only. At eight and a half miles we had passed an island in the middle of the river, which we called Good-hope island. At one and a half mile we reached a creek on the south side about twelve yards wide, to which we gave the name of Teal creek. A little above this is an island on the north side of the current, about one and a half mile in length and three quarters of a mile in breadth. In the centre of this island is an old village of the Ricaras, called Lahoocat; it was surrounded by a circular wall, containing seventeen lodges. The Ricaras are known to have lived there in 1797, and the village seems to have been deserted about five years since; it does not contain much timber. We encamped on a sandbar making out from the upper end of this island; our journey to-day being twelve miles.

Friday, October 5. The weather was very cold: yesterday evening and this morning there was a white frost. We sailed along the highlands on the north side, passing a small creek on the south,

between three and four miles. At seven o'clock we heard some yells and saw three Indians of the Teton band, who asked us to come on shore and begged for some tobacco; to all which we gave the same answer as hitherto. At eight miles we reached a small creek on the north. At fourteen we passed an island on the south, covered with wild rye, and at the head a large creek comes in from the south, which we named Whitebrant creek, from seeing several white brants among flocks of dark-coloured ones. At the distance of twenty miles we came to on a sandbar towards the north side of the river, with a willow island opposite; the hills or bluffs come to the banks of the river on both sides, but are not so high as they are below: the river itself however continues of the same width, and the sandbars are quite as numerous. The soil of the banks is dark coloured, and many of the bluffs have the appearance of being on fire. Our game this day was a deer, a prairie wolf, and some goats out of a flock that was swimming across the river.

Saturday, October 6. The morning was still cold, the wind being from the north. At eight miles we came to a willow island on the north, opposite a point of timber, where there are many large stones near the middle of the river, which seem to have been washed from the hills and high plains on both sides, or driven from a distance down the stream. At twelve miles we halted for dinner at a village which we suppose to have belonged to the Ricaras:

it is situated in a low plain on the river, and consists of about eighty lodges of an octagon form, neatly covered with earth, placed as close to each other as possible, and picketted round. The skin canoes, mats, buckets, and articles of furniture found in the lodges, induce us to suppose that it had been left in the spring. We found three different sorts of squashes growing in the village; we also killed an elk near it, and saw two wolves. On leaving the village the river became shallow, and after searching a long time for the main channel, which was concealed among sandbars, we at last dragged the boat over one of them rather than go back three miles for the deepest channel. At fourteen and a half miles we stopped for the night on a sandbar, opposite a creek on the north, called Otter creek, twenty-two yards in width, and containing more water than is common for creeks of that size. The sides of the river during the day are variegated with high bluffs and low timbered grounds on the banks: the river is very much obstructed by sandbars. We saw geese, swans, brants, and ducks of different kinds on the sandbars, and on shore numbers of the prairie hen; the magpie too is very common; but the gulls and plover, which we saw in such numbers below, are now quite rare.

Sunday, October 7. There was frost again last evening, and this morning was cloudy and attended with rain. At two miles we came to the mouth of

a river; called by the Ricaras, Sawawkawna, or Pork river: the party who examined it for about three miles up, say that its current is gentle, and that it does not seem to throw out much sand. Its sources are the first range of the Black mountains, and though it has now only water of twenty yards width, yet when full it occupies ninety. Just below the mouth is another village or wintering camp of the Ricaras, composed of about sixty lodges, built in the same form as those passed yesterday, with willow and straw mats, baskets and buffaloe-skin canoes remaining entire in the camp. We proceeded under a gentle breeze from the south-west: at ten o'clock we saw two Indians on the north side, who told us they were part of the lodge of Tartongawaka, or Buffaloe Medicine, the Teton chief whom we had seen on the twenty-fifth, that they were on the way to the Ricaras, and begged us for some thing to eat, which we of course gave them. At seven and a half miles is a willow island on the north, and another on the same side five miles beyond it, in the middle of the river between highlands on both sides. At eighteen and a half miles is an island called Grouse island, on which are the walls of an old village: the island has no timber, but is covered with grass and wild rye, and owes its name to the number of grouse that frequent it. We then went on till our journey for the day was twenty-two miles: the country presented the same appearance as usual. In the

low timbered ground near the mouth of the Sawawkawna, we saw the tracks of large white bears, and on Grouse island killed a female blaireau, and a deer of the black-tailed species, the largest we have ever seen.

Monday, October 8. We proceeded early with a cool north-west wind, and at two and a half miles above Grouse island, reached the mouth of a creek on the south, then a small willow island, which divides the current equally; and at four and a half miles came to a river on the southern side where we halted. This river, which our meridian altitude fixes at $45^{\circ} 39' 5''$ north latitude, is called by the Ricaras Wetawhoo; it rises in the Black mountains, and its bed which flows at the mouth over a low soft slate stone, is one hundred and twenty yards wide, but the water is now confined within twenty yards, and is not very rapid, discharging mud with a small proportion of sand: here, as in every bend of the river, we again observe the red berries resembling currants, which we mentioned before. Two miles above the Wetawhoo, and on the same side, is a small river called Maropa by the Indians; it is twenty yards in width, but so dammed up by mud that the stream creeps through a channel of not more than an inch in diameter, and discharges no sand. One mile further we reached an island close to the southern shore, from which it is separated by a deep channel of sixty yards. About half way a number of Ricara Indians came out to see us. We stopped and took a Frenchman on

board, who accompanied us past the island to our camp on the north side of the river, which is at the distance of twelve miles from that of yesterday. Captain Lewis then returned with four of the party to see the village; it is situated in the centre of the island, near the southern shore, under the foot of some high, bald, uneven hills, and contains about sixty lodges. The island itself is three miles long, and covered with fields in which the Indians raise corn, beans, and potatoes. Several Frenchmen, living among these Indians as interpreters, or traders, came back with Captain Lewis, and particularly a Mr. Gravelines, a man who has acquired the language. On setting out we had a low prairie covered with timber on the north, and on the south highlands, but at the mouth of the Wetawhoo the southern country changes, and a low timbered plain extends along the south, while the north has a ridge of barren hills during the rest of the day's course.

Tuesday, 9th. The wind was so cold and high last night, and during all the day, that we could not assemble the Indians in council; but some of the party went to the village. We received the visits of the three principal chiefs with many others, to whom we gave some tobacco, and told them that we would speak to them to-morrow. The names of these chiefs were, first, Kakawissassa, or Lighting Crow; second chief, Pocasse or Hay; third chief, Piahetto, or Eagle's Feather. Notwithstanding the high waves, two or three squaws

rowed to us in little canoes made of a single buf-faloe skin, stretched over a frame of boughs interwoven like a basket, and with the most perfect composure. The object which appeared to astonish the Indians most, was Captain Clarke's servant, York, a remarkable stout strong negro. They had never seen a being of that colour, and therefore flocked round him to examine the extraordinary monster. By way of amusement, he told them that he had once been a wild animal, and caught and tamed by his master, and to convince them, showed them feats of strength, which added to his looks, made him more terrible than we wished him to be. Opposite our camp is a small creek on the south, which we distinguished by the name of the chief Kaka-wissassa.

Wednesday, 10th. The weather was this day fine, and as we were desirous of assembling the whole nation at once, we dispatched Mr. Gravelines, who, with Mr. Tabeau another French trader, had breakfasted with us, to invite the chiefs of the two upper villages to a conference. They all assembled at one o'clock, and after the usual ceremonies we addressed them in the same way in which we had already spoken to the Ottoes and Sioux: we then made or acknowledged three chiefs, one for each of the three villages; giving to each a flag, a medal, a red coat, a cocked hat and feather, also some goods, paint, and tobacco, which they divided among themselves: after this the air-gun was exhibited, very much to their astonishment,

nor were they less surprised at the colour and manner of York. On our side we were equally gratified at discovering that these Ricaras made use of no spirituous liquors of any kind, the example of the traders who bring it to them, so far from tempting have in fact disgusted them. Supposing that it was as agreeable to them as to the other Indians, we had at first offered them whiskey; but they refused it with this sensible remark, that they were surprised that their father should present to them a liquor which would make them fools. On another occasion they observed to Mr. Tabeau, that no man could be their friend who tried to lead them into such follies. The council being over, they retired to consult on their answer, and the next morning,

Thursday, 11th, at eleven o'clock we again met in council at our camp. The grand chief made a short speech of thanks for the advice we had given, and promised to follow it; adding that the door was now open and no one dare shut it, and that we might depart whenever we pleased, alluding to the treatment we had received from the Sioux: they also brought us some corn, beans, and dried squashes, and in return we gave them a steel mill, with which they were much pleased. At one o'clock we left our camp with the grand chief and his nephew on board, and at about two miles anchored below a creek on the south, separating the second and third villages of the Ricaras, which are about half a mile distant from each other. We

visited both the villages, and sat conversing with the chiefs for some time, during which they presented us with a bread made of corn and beans, also corn and beans boiled, and a large rich bean which they take from the mice of the prairie, who discover and collect it. These two villages are placed near each other in a high smooth prairie; a fine situation, except that having no wood the inhabitants are obliged to go for it across the river to a timbered lowland opposite to them. We told them that we would speak to them in the morning at their villages separately.

Thursday, 12th. Accordingly after breakfast we went on shore to the house of the chief of the second village named Lassel, where we found his chiefs and warriors. They made us a present of about seven bushels of corn, a pair of leggings, a twist of their tobacco, and the seeds of two different species of tobacco. The chief then delivered a speech expressive of his gratitude for the presents and the good counsels which we had given him; his intention of visiting his great father but for fear of the Sioux; and requested us to take one of the Ricara chiefs up to the Mandans and negotiate a peace between the two nations. To this we replied in a suitable way, and then repaired to the third village. Here we were addressed by the chief in nearly the same terms as before, and entertained with a present of ten bushels of corn, some beans, dried pumpkins, and squashes. After we had answered and explained

the magnitude and power of the United States, the three chiefs came with us to the boat. We gave them some sugar, a little salt, and a sun-glass. Two of them then left us, and the chief of the third, by name Ahketahnasha or Chief of the Town, accompanied us to the Mandans. At two o'clock we left the Indians, who crowded to the shore to take leave of us, and after making seven and a half miles landed on the north side, and had a clear, cool, pleasant evening.

The three villages which we have just left, are the residence of a nation called the Ricaras. They were originally colonies of Pawnees, who established themselves on the Missouri, below the Chayenne, where the traders still remember that twenty years ago they occupied a number of villages. From that situation a part of the Ricaras emigrated to the neighbourhood of the Mandans, with whom they were then in alliance. The rest of the nation continued near the Chayenne till the year 1797, in the course of which, distressed by their wars with the Sioux, they joined their countrymen near the Mandans. Soon after a new war arose between the Ricaras and the Mandans, in consequence of which the former came down the river to their present position. In this migration those who had first gone to the Mandans kept together, and now live in the two lower villages, which may thence be considered as the Ricaras proper. The third village was composed of such remnants of the villages as had survived the wars, and as these were nine in

number, a difference of pronunciation and some difference of language may be observed between them and the Ricaras proper, who do not understand all the words of these wanderers. The villages are within the distance of four miles of each other, the two lower ones consisting of between one hundred and fifty and two hundred men each, the third of three hundred. The Ricaras are tall and well-proportioned, the women handsome and lively, and, as among other savages, to them falls all the drudgery of the field and the labours of procuring subsistence, except that of hunting: both sexes are poor, but kind and generous, and although they receive with thankfulness what is given to them, do not beg as the Sioux did, though this praise should be qualified by mentioning that an axe was stolen last night from our cooks. The dress of the men is a simple pair of moccasins, leggings, and a cloth round the middle, over which a buffaloe robe is occasionally thrown, with their hair, arms, and ears decorated with different ornaments. The women wear moccasins, leggings, and a long shirt made of goats' skins, generally white and fringed, which is tied round the waist; to these they add, like the men, a buffaloe robe without the hair, in summer. These women are handsomer than the Sioux; both of them are however, disposed to be amorous, and our men found no difficulty in procuring companions for the night by means of the interpreters. These interviews were chiefly clandestine, and were of course to be kept a secret from the husband or re-

lations. The point of honour indeed, is completely reversed among the Ricaras; that the wife or the sister should submit to a stranger's embraces without the consent of her husband or brother, is a cause of great disgrace and offence, especially as for many purposes of civility or gratitude the husband and brother will themselves present to a stranger these females, and be gratified by attentions to them. The Sioux had offered us squaws, but while we remained there, having declined, they followed us with offers of females for two days. The Ricaras had been equally accommodating; we had equally withstood their temptation; but such was their desire to oblige that two very handsome young squaws were sent on board this evening, and persecuted us with civilities. The black man York participated largely in these favours; for instead of inspiring any prejudice, his colour seemed to procure him additional advantages from the Indians, who desired to preserve among them some memorial of this wonderful stranger. Among other instances of attention, a Ricara invited him into his house and presenting his wife to him, retired to the outside of the door: while there, one of York's comrades who was looking for him came to the door, but the gallant husband would permit no interruption before a reasonable time had elapsed.

The Ricara lodges are in a circular or octagonal form, and generally about thirty or forty feet in diameter: they are made by placing forked posts about six feet high round the circumference of the

circle; these are joined by poles from one fork to another, which are supported also by other forked poles slanting from the ground: in the centre of the lodge are placed four higher forks, about fifteen feet in length, connected together by beams; from these to the lower poles the rafters of the roof are extended so as to leave a vacancy in the middle for the smoke: the frame of the building is then covered with willow branches, with which is interwoven grass, and over this mud or clay: the aperture for the door is about four feet wide, and before it is a sort of entry about ten feet from the lodge. They are very warm and compact.

They cultivate maize or Indian corn, beans, pumpkins, water-melons, squashes, and a species of tobacco peculiar to themselves.

Their commerce is chiefly with the traders, who supply them with goods in return for peltries, which they procure not only by their own hunting, but in exchange for corn from their less civilized neighbours. The object chiefly in demand seemed to be red paint, but they would give any thing they had to spare for the most trifling article. One of the men to-day gave an Indian a hook made out of a pin, and he gave him in return a pair of moccasins.

They express a disposition to keep at peace with all nations, but they are well armed with fusils, and being much under the influence of the Sioux, who exchanged the goods which they got from the British for Ricara corn, their minds are sometimes

poisoned and they cannot be always depended on. At the present moment they are at war with the Mandans. We are informed by Mr. Gravelines, who had passed through that country, that the Yankton or Jacques river rises about forty miles to the east or north-east of this place, the Chayenne branch of the Red river about twenty miles further, passing the Sioux, and the St. Peter's about eighty.

Saturday, 13th. In the morning our visitors left us, except the brother of the chief who accompanies us and one of the squaws. We passed at an early hour a camp of Sioux on the north bank, who merely looked at us without saying a word, and from the character of the tribe we did not solicit a conversation. At ten and a half miles we reached the mouth of a creek on the north, which takes its rise from some ponds a short distance to the north-east: to this stream we gave the name of Stone-idol creek, for after passing a willow and sand island just above its mouth, we discovered that a few miles back from the Missouri there are two stones resembling human figures, and a third like a dog; all which are objects of great veneration among the Ricaras. Their history would adorn the metamorphoses of Ovid. A young man was deeply enamoured with a girl whose parents refused their consent to the marriage. The youth went out into the fields to mourn his misfortunes; a sympathy of feeling led the lady to the same spot, and the faithful dog would not cease to follow his master.

After wandering together, and having nothing but grapes to subsist on, they were at last converted into stone, which beginning at the feet gradually invaded the nobler parts, leaving nothing unchanged but a bunch of grapes which the female holds in her hands to this day. Whenever the Ricaras pass these sacred stones, they stop to make some offering of dress to propitiate these deities. Such is the account given by the Ricara chief which we had no mode of examining, except that we found one part of the story very agreeably confirmed; for on the river near where the event is said to have occurred, we found a greater abundance of fine grapes than we had yet seen. Above this is a small creek four and a half miles from Stone-idol creek, which is fifteen yards wide, comes in from the south, and received from us the name of Pocasse or Hay creek, in honour of the chief of the second village. Above the Ricara island, the Missouri becomes narrow and deeper, the sandbars being generally confined to the points; the current too is much more gentle; the timber on the lowlands is also in much greater quantities, though the high grounds are still naked. We proceeded on under a fine breeze from the south-east, and after making eighteen miles encamped on the north, near a timbered low plain, after which we had some rain and the evening was cold. The hunters killed one deer only.

Sunday, 14th. We set out in the rain which continued during the day. At five miles we came

to a creek on the south, about fifteen yards wide, and named by us Piahetto, or Eagle's Feather, in honour of the third chief of the Ricaras. After dinner we stopped on a sandbar, and executed the sentence of a court martial, which inflicted corporal punishment on one of the soldiers. This operation affected the Indian chief very sensibly, for he cried aloud during the punishment: we explained the offence and the reasons of it. He acknowledged that examples were necessary, and that he himself had given them by punishing with death: but his nation never whipped even children from their birth. After this we continued with the wind from the north-east, and at the distance of twelve miles, encamped in a cove of the southern bank. Immediately opposite our camp on the north side are the ruins of an ancient fortification, the greater part of which is washed into the river: nor could we distinguish more than that the walls were eight or ten feet high. The evening is wet and disagreeable, and the river, which is somewhat wider than yesterday, continues to have an unusual quantity of timber. The country was level on both sides in the morning, but afterwards we passed some black bluffs on the south.

Monday, 15th. We stopped at three miles on the north a little above a camp of Ricaras who are hunting, where we were visited by about thirty Indians: they came over in their skin canoes, bringing us meat, for which we returned them beads and fishhooks. About a mile higher we found

another encampment of Ricaras on the south, consisting of eight lodges: here we again ate and exchanged a few presents. As we went we discerned numbers of other Indians on both sides of the river; and at about nine miles we came to a creek on the south, where we saw many high hills resembling a house with a slanting roof; and a little below the creek an old village of the Sharha or Chayenne Indians. The morning had been cloudy, but the evening became pleasant, the wind from the north-east, and at sunset we halted, after coming ten miles over several sandbars and points, above a camp of ten Ricara lodges on the north side. We visited their camp, and smoked and ate with several of them; they all appeared kind and pleased with our attentions, and the fair sex received our men with more than hospitality. York was here again an object of astonishment; the children would follow him constantly, and if he chanced to turn towards them, run with great terror. The country of today is generally low and covered with timber on both sides, though in the morning we passed some barren hills on the south.

Tuesday, 16th. At this camp the squaw who accompanied the chief left us; two others were very anxious to go on with us. Just above our camp we passed a circular work or fort, where the Sharha or Chayennes formerly lived: and a short distance beyond, a creek which we called Chayenne creek. At two miles is a willow island with a large sandbar on both sides above it, and a creek, both on the

south, which we called Sohawch, the Ricara name for girl; and two miles above a second creek, to which we gave the name of Chapawt, which means woman in the same language. Three miles further is an island situated in a bend to the north, about a mile and a half long, and covered with cottonwood. At the lower end of this island comes in a small creek from the north, called Keetooshahawna or Place of Beaver. At the upper extremity of the island a river empties itself from the north: it is called Warreconne, or Elk Shed their Horns; and is about thirty-five yards wide: the island itself is named Carp island by Evans, a former traveller. As we proceeded there were great numbers of goats on the banks of the river, and we soon after saw large flocks of them in the water: they had been gradually driven into the river by the Indians who now lined the shore so as to prevent their escape, and were firing on them, while sometimes boys went into the river and killed them with sticks: they seemed to be very successful, for we counted fifty-eight which they had killed. We ourselves killed some, and then passing the lodges to which these Indians belonged, encamped at the distance of half a mile on the south, having made fourteen and a half miles. We were soon visited by numbers of these Ricaras, who crossed the river hallooing and singing: two of them then returned for some goat's flesh and buffaloe meat dried and fresh, with which they made a feast that lasted till late at night, and caused much music and merriment.

Wednesday, 17th. The weather was pleasant: we passed a low ground covered with small timber on the south, and barren hills on the north which came close to the river; the wind from the north-west then became so strong that we could not move after ten o'clock, until late in the afternoon, when we were forced to use the towline, and we therefore made only six miles. We all went out hunting and examining the country. The goats, of which we see large flocks coming to the north bank of the river, spend the summer, says Mr. Gravelines, in the plains east of the Missouri, and at the present season are returning to the Black mountains, where they subsist on leaves and shrubbery during the winter, and resume their migrations in the spring. We also saw buffaloe, elk, and deer, and a number of snakes; a beaver house too was seen, and we caught a whip-poor-will of a small and uncommon kind: the leaves are fast falling; the river wider than usual and full of sandbars: and on the sides of the hills are large stones, and some rock of a brownish colour in the southern bend below us. Our latitude by observation was $46^{\circ} 23' 57''$.

Thursday, 18. After three miles we reached the mouth of Le Boulet or Cannonball river: this stream rises in the Black mountains, and falls into the Missouri on the south; its channel is about one hundred and forty yards wide, though the water is now confined within forty, and its name is derived from the numbers of perfectly round large stones on the shore and in the bluffs just

above. We here met with two Frenchmen in the employ of Mr. Gravelines, who had been robbed by the Mandans of their traps, furs, and other articles, and were descending the river in a perioque, but they turned back with us in expectation of obtaining redress through our means. At eight miles is a creek on the north, about twenty-eight yards wide, rising in the north-east, and called Chewah or Fish river; one mile above this is another creek on the south: we encamped on a sandbar to the south, at the distance of thirteen miles, all of which we had made with oars and poles. Great numbers of goats are crossing the river and directing their course to the westward; we also saw a herd of buffaloe and of elk; a pelican too was killed, and six fallow deer, having found, as the Ricaras informed us, that there are none of the black-tail species, as high up as this place. The country is, in general, level and fine, with broken short high grounds, low timbered mounds on the river, and a rugged range of hills at a distance.

Friday, 19. We set sail with a fine morning, and a south-east wind, and at two and a half miles passed a creek on the north side: at eleven and a half miles we came to a lake or large pond on the same side, in which were some swans. On both banks of the Missouri are low grounds which have much more timber than lower down the river: the hills are at one or two miles distance from the banks, and the streams which rise in them are

brackish, and the mineral salts appear on the sides of the hills and edges of the runs. In walking along the shore we counted fifty-two herds of buffaloe, and three of elk, at a single view. Besides these we also observed elk, deer, pelicans, and wolves. After seventeen and a half miles we encamped on the north, opposite to the uppermost of a number of round hills, forming a cone at the top, one being about ninety, another sixty feet in height, and some of less elevation. Our chief tells us that the calumet bird lives in the holes formed by the filtration of the water from the top of these hills through the sides. Near to one of these moles, on a point of a hill ninety feet above the plain, are the remains of an old village which is high, strong, and has been fortified; this our chief tells us is the remains of one of the Mandan villages, and are the first ruins which we have seen of that nation in ascending the Missouri: opposite to our camp is a deep bend to the south, at the extremity of which is a pond.

Saturday, 20. We proceeded early with a south-east wind, which continued high all day, and came to a creek on the north at two miles distance, twenty yards wide. At eight miles we reached the lower point of an island in the middle of the river, though there is no current on the south. This island is covered with willows and extends about two miles, there being a small creek coming in from the south at its lower extremity. After making twelve miles we encamped on the south, at

the upper part of a bluff containing stone-coal of an inferior quality; immediately below this bluff and on the declivity of a hill, are the remains of a village covering six or eight acres, formerly occupied by the Mandans, who, says our Ricara chief, once lived in a number of villages on each side of the river, till the Sioux forced them forty miles higher; whence, after a few years residence, they moved to their present position. The country through which we passed has wider bottoms and more timber than those we have been accustomed to see, the hills rising at a distance and by gradual ascents. We have seen great numbers of elk, deer, goats, and buffaloe, and the usual attendants of these last, the wolves, who follow their movements and feed upon those who die by accident, or who are too poor to keep pace with the herd; we also wounded a white bear, and saw some fresh tracks of those animals which are twice as large as the track of a man.

Sunday, 21. Last night the weather was cold, the wind high from the north-east, and the rain which fell froze on the ground. At daylight it began to snow, and continued till the afternoon, when it remained cloudy and the ground was covered with snow. We, however, set out early, and just above our camp came to a creek on the south, called Chisshetaw, about thirty yards wide and with a considerable quantity of water. Our Ricara chief tells us, that at some distance up this river is situated a large rock which is held in great

veneration, and visited by parties who go to consult it as to their own or their nations' destinies, all of which they discern in some sort of figures or paintings with which it is covered. About two miles off from the mouth of the river the party on shore saw another of the objects of Ricara superstition: it is a large oak tree, standing alone in the open prairie, and as it alone has withstood the fire which has consumed every thing around, the Indians naturally ascribe to it extraordinary powers. One of their ceremonies is to make a hole in the skin of their necks through which a string is passed and the other end tied to the body of the tree; and after remaining in this way for some time they think they become braver. At two miles from our encampment we came to the ruins of a second Mandan village, which was in existence at the same time with that just mentioned. It is situated on the north at the foot of a hill in a beautiful and extensive plain, which is now covered with herds of buffaloe: nearly opposite are remains of a third village on the south of the Missouri; and there is another also about two miles further on the north, a little off the river. At the distance of seven miles we encamped on the south, and spent a cold night. We procured to-day a buffaloe and an otter only. The river is wide and the sandbars numerous, and a low island near our encampment.

Monday, 22. In the morning we passed an old Mandan village on the south, near our camp; at four miles another on the same side. About seven

o'clock we came to at a camp of eleven Sioux of the Teton tribe, who are almost perfectly naked, having only a piece of skin or cloth round the middle, though we are suffering from the cold. From their appearance, which is warlike, and from their giving two different accounts of themselves, we believe that they are either going to or returning from the Mandans, to which nations the Sioux frequently make excursions to steal horses. As their conduct displeased us, we gave them nothing. At six we reached an island about one mile in length, at the head of which is a Mandan village on the north in ruins, and two miles beyond a bad sand-bar. At eight miles are remains of another Mandan village on the south; and at twelve miles we encamped on the south. The hunters brought in a buffaloe bull, and mentioned that of about three hundred which they had seen, there was not a single female. The beaver is here in plenty, and the two Frenchmen, who are returning with us, catch several every night.

These villages, which are nine in number, are scattered along each side of the river within a space of twenty miles; almost all that remains of them is the wall which surrounded them, the fallen heaps of earth which covered the houses and occasionally human skulls and the teeth and bones of men, and different animals, which are scattered on the surface of the ground.

Tuesday, 23. The weather was cloudy and we had some snow; we soon arrived at Five Lodges

where the two Frenchmen had been robbed, but the Indians had left it lately as we found the fires still burning. The country consists, as usual, of timbered low grounds, with grapes, rushes, and great quantities of a small red acid fruit, known among the Indians by a name signifying rabbitberries, and called by the French *graisse de buffle* or buffaloe fat. The river too, is obstructed by many sand-bars. At twelve miles we passed an old village on the north, which was the former residence of the Ahnahaways who now live between the Mandans and Mimmetarees. After making thirteen miles we encamped on the south.

Wednesday, 24. The day was again dark and it snowed a little in the morning. At three miles we came to a point on the south, where the river, by forcing a channel across a former bend, has formed a large island on the north. On this island we found one of the grand chiefs of the Mandans, who with Five Lodges was on a hunting excursion. He met his enemy the Ricara chief, with great ceremony and apparent cordiality, and smoked with him. After visiting his lodges, the grand chief and his brother came on board our boat for a short time; we then proceeded and encamped on the north, at seven miles from our last night's station and below the old village of the Mandans and Ricaras. Here four Mandans came down from a camp above, and our Ricara chief returned with them to their camp, from which we augur favourably of their pacific views towards each other. The land is low and

beautiful, and covered with oak and cottonwood, but has been too recently hunted to afford much game.

25th. The morning was cold and the wind gentle from the south-east: at three miles we passed a handsome high prairie on the south, and on an eminence about forty feet above the water, and extending back for several miles on a beautiful plain, was situated an old village of the Mandan nation, which has been deserted for many years. A short distance above it, on the continuation of the same rising ground are two old villages of Ricaras, one on the top of the hill, the other in the level plain, which have been deserted only five years ago. Above these villages is an extensive low ground for several miles, in which are situated, at three or four miles from the Ricara villages, three old villages of Mandans near together. Here the Mandans lived when the Ricaras came to them for protection, and from this they moved to their present situation above. In the low ground the squaws raised their corn, and the timber of which there was little near the villages, was supplied from the opposite side of the river, where it was and still is abundant.

As we proceeded, several parties of Mandans both on foot and horseback came along the river to view us, and were very desirous that we should land and talk to them: this we could not do on account of the sandbreaks on the shore, but we sent out the Ricara chief to them in a perioque. The wind

too having shifted to the south-west; and being very high, it required all our precautions on board, for the river was full of sandbars, which made it very difficult to find the channel. We got aground several times, and passed a very bad point of rocks, after which we encamped on a sandpoint to the north, above a handsome plain covered with timber, and opposite to a high hill on the south side at the distance of eleven miles. Here we were joined by our Ricara chief, who brought an Indian to the camp where he remained all night.

26th. We set out early with a south-west wind, and after putting the Ricara chief on shore to join the Mandans, who were in great numbers along it, we proceeded to the camp of the grand chiefs, four miles distant. Here we met a Mr. M'Cracken one of the North-West or Hudson Bay company, who arrived with another person about nine days ago to trade for horses and buffaloe robes. Two of the chiefs came on board with some of their household furniture, such as earthen pots and a little corn, and went on with us; the rest of the Indians following on shore. At one mile beyond the camp we passed a small creek, and at three more a bluff of coal of an inferior quality on the south. After making eleven miles we reached an old field where the Mandans had cultivated grain last summer, and encamped for the night on the south side, about half a mile below the first village of the Mandans. In the morning we had a willow low ground on the south and

highland on the north, which occasionally varied in the course of the day. There is but little wood on this part of the river, which is here subdivided into many channels and obstructed by sandbars. As soon as we arrived a crowd of men, women, and children, came down to see us. Captain Lewis returned with the principal chiefs to the village, while the others remained with us during the evening; the object which seemed to surprize them most, was a corn-mill fixed to the boat which we had occasion to use, and delighted them by the ease with which it reduced the grain to powder. Among others who visited us was the son of the grand chief of the Mandans, who had his two little fingers cut off at the second joints. On inquiring into this accident, we found that it was customary to express grief for the death of relations by some corporeal suffering, and that the usual mode was to lose two joints of the little fingers, or sometimes the other fingers. The wind blew very cold in the evening from the south-west. Two of the party were affected with rheumatic complaints.

CHAPTER V.

COUNCIL HELD WITH THE MANDANS — A PRAIRIE ON FIRE, AND A SINGULAR INSTANCE OF PRESERVATION — PEACE ESTABLISHED BETWEEN THE MANDANS AND RICARAS — THE PARTY ENCAMP FOR THE WINTER — INDIAN MODE OF CATCHING GOATS — BEAUTIFUL APPEARANCE OF NORTHERN LIGHTS — FRIENDLY CHARACTER OF THE INDIANS — SOME ACCOUNT OF THE MANDANS — THE AHNNAHAWAYS AND THE MINNETAREES — THE PARTY ACQUIRE THE CONFIDENCE OF THE MANDANS BY TAKING PART IN THEIR CONTROVERSY WITH THE SIOUX — RELIGION OF THE MANDANS, AND THEIR SINGULAR CONCEPTION OF THE TERM MEDICINE — THEIR TRADITION — THE SUFFERINGS OF THE PARTY FROM THE SEVERITY OF THE SEASON — INDIAN GAME OF BILLIARDS DESCRIBED — CHARACTER OF THE MISSOURI, OF THE SURROUNDING COUNTRY, AND OF THE RIVERS, CREEKS, ISLANDS, &c.

SATURDAY, October 27. At an early hour we proceeded and anchored off the village. Captain Clarke went on shore, and after smoking a pipe with the chiefs, was desired to remain and eat with them. He declined on account of his being unwell; but his refusal gave great offence to the Indians, who considered it disrespectful not to eat when invited, till the cause was explained to their satisfaction. We sent them some tobacco, and then proceeded to the second village on the north, pass-

ing by a bank containing coal, and a second village, and encamped at four miles on the north, opposite to a village of Ahnahaways. We here met with a Frenchman, named Jesseaume, who lives among the Indians with his wife and children, and whom we take as an interpreter. The Indians had flocked to the bank to see us as we passed, and they visited in great numbers the camp, where some of them remained all night. We sent in the evening three young Indians with a present of tobacco for the chiefs of the three upper villages, inviting them to come down in the morning to a council with us. Accordingly the next day,

Sunday, October 28, we were joined by many of the Minnetarees and Ahnahaways from above, but the wind was so violent from the south-west that the chiefs of the lower villages could not come up, and the council was deferred till tomorrow. In the mean while we entertained our visitors by showing them what was new to them in the boat; all which, as well as our black servant, they called Great Medicine, the meaning of which we afterwards learnt. We also consulted the grand chief of the Mandans, Black Cat, and Mr. Jesseaume, as to the names, characters, &c. of the chiefs with whom we are to hold the council. In the course of the day we received several presents from the women, consisting of corn, boiled hominy, and garden stuffs: in our turn we gratified the wife of the great chief with a gift of a glazed earthen jar. Our hunter brought us two beaver.

In the afternoon we sent the Minnetaree chiefs to smoke for us with the great chief of the Mandans, and told them we would speak in the morning.

Finding that we shall be obliged to pass the winter at this place, we went up the river about one and a half mile to-day, with a view of finding a convenient spot for a fort, but the timber was too scarce and small for our purposes.

Monday, October 29. The morning was fine and we prepared our presents and speech for the council. After breakfast we were visited by an old chief of the Ahnahaways, who finding himself growing old and weak, had transferred his power to his son, who is now at war against the Shoshonees. At ten o'clock the chiefs were all assembled under an awning of our sails, stretched so as to exclude the wind which had become high; that the impression might be the more forcible, the men were all paraded, and the council opened by a discharge from the swivel of the boat. We then delivered a speech, which like those we had already made, intermingled advice with assurances of friendship and trade: while we were speaking the old Ahnahaway chief grew very restless, and observed that he could not wait long, as his camp was exposed to the hostilities of the Shoshonees; he was instantly rebuked with great dignity by one of the chiefs for this violation of decorum at such a moment, and remained quiet during the rest of the council. Towards the end of our speech we introduced the subject of our Ricara chief, with

whom we recommended a firm peace: to this they seemed well disposed, and all smoked with him very amicably. We all mentioned the goods which had been taken from the Frenchmen, and expressed a wish that they should be restored. This being over, we proceeded to distribute the presents with great ceremony: one chief of each town was acknowledged by a gift of a flag, a medal with the likeness of the president of the United States, a uniform coat, hat and feather: to the second chiefs we gave a medal representing some domestic animals, and a loom for weaving: to the third chiefs, medals with the impressions of a farmer sowing grain. A variety of other presents were distributed, but none seemed to give them more satisfaction than an iron corn-mill which we gave to the Mandans.

The chiefs who were made to-day are: Shahaka or Big White, a first chief, and Kagohami or Little Raven, a second chief of the lower village of the Mandans, called Matootonha: the other chiefs of an inferior quality who were recommended were, 1. Ohheenaw, or Big Man, a Chayenne taken prisoner by the Mandans who adopted him, and he now enjoys great consideration among the tribe. 2. Shotahawwora, or coal, of the second Mandan village, which is called Roptahee. We made Poscopsahe, or Black Cat, the first chief of the village, and the grand chief of the whole Mandan nation: his second chief is Kagonomokshe, or Raven man chief; inferior chiefs of this village were, Tawnuho,

and Bellahsara, of which we did not learn the translation.

In the third village, which is called Mahawha, and where the Arwacahwas reside, we made one first chief, Tetuckopinreha, or White Buffalo robe unfolded, and recognised two of an inferior order: Minnissurraree, or Neighing Horse, and Locongotiha, or Old Woman at a distance.

Of the fourth village, where the Minnetarees live, and which is called Metaharta, we made a first chief, Ompsehara, or Black Moccasin: a second chief, Ohhaw, or Little Fox. Other distinguished chiefs of this village were, Mahnotah, or Big Thief, a man whom we did not see as he was out fighting, and was killed soon after; and Mahserassa, or Tail of the Calumet Bird. In the fifth village we made a first chief Eapanopa, or Red Shield; a second chief Wankerassa, or Two Tailed Calumet Bird, both young chiefs; other persons of distinction are, Shahakohopinnee, or little Wolf's Medicine; Ah-rattanamockshee, or Wolfman chief, who is now at war, and is the son of the old chief we have mentioned, whose name is Caltahcota, or Cherry on a Bush.

The presents intended for the grand chief of the Minnetarees, who was not at the council, were sent to him by the old chief Caltahcota; and we delivered to a young chief those intended for the chief of the lower village. The council was concluded by a shot from our swivel, and after firing the airgun for their amusement, they retired to de-

liberate on the answer which they are to give to-morrow.

In the evening the prairie took fire, either by accident or design, and burned with great fury, the whole plain being enveloped in flames; so rapid was its progress that a man and woman were burnt to death before they could reach a place of safety; another man with his wife and child were much burnt, and several other persons narrowly escaped destruction. Among the rest a boy of the half white breed escaped unhurt in the midst of the flames; his safety was ascribed to the great medicine spirit, who had preserved him on account of his being white. But a much more natural cause was the presence of mind of his mother, who seeing no hopes of carrying off her son, threw him on the ground, and covering him with the fresh hide of a buffalo, escaped herself from the flames; as soon as the fire had passed, she returned and found him untouched, the skin having prevented the flame from reaching the grass on which he lay.

Tuesday, 30. We were this morning visited by the two persons from the lower village, one the Big White the chief of the village, the other the Chayenne called the Big Man; they had been hunting, and did not return yesterday early enough to attend the council. At their request we repeated part of our speech of yesterday, and put the medal round the neck of the chief. Captain Clarke took a perioque and went up the river in search of a good wintering place, and returned after going seven

miles to the lower point of an island on the north side, about one mile in length; he found the banks on the north side high with coal occasionally, and the country fine on all sides; but the want of wood and the scarcity of game up the river, induced us to decide on fixing ourselves lower down during the winter. In the evening our men danced among themselves to the great amusement of the Indians.

Wednesday, 31. A second chief arrived this morning with an invitation from the grand chief of the Mandans, to come to his village where he wished to present some corn to us and to speak with us. Captain Clarke walked down to his village; he was first seated with great ceremony on a robe by the side of the chief, who then threw over his shoulders another robe handsomely ornamented. The pipe was then smoked with several of the old men who were seated around the chief; after some time he began his discourse, by observing, that he believed what we had told him, and that they should soon enjoy peace, which would gratify him as well as his people, because they could then hunt without fear of being attacked, and the women might work in the fields without looking every moment for the enemy, and at night put off their moccasins, a phrase by which is conveyed the idea of security, when the women could undress at night without fear of attack. As to the Ricaras, he continued, in order to show you that we wish peace with all men, that chief, pointing to his second chief, will go with some warriors back to the Ricaras with

their chief now here and smoke with that nation. When we heard of your coming all the nations around returned from their hunting to see you, in hopes of receiving large presents; all are disappointed and some discontented; for his part he was not much so, though his village was. He added that he would go and see his great father the president. Two of the steel traps stolen from the Frenchmen were then laid before Captain Clarke, and the women brought about twelve bushels of corn. After the chief had finished, Captain Clarke made an answer to the speech and then returned to the boat, where he found the chief of the third village and Kagohami (the Little Raven) who smoked and talked about an hour. After they left the boat the grand chief of the Mandans came dressed in the clothes we had given him, with his two children, and begged to see the men dance, in which they willingly gratified him.

Thursday, November 1st. Mr. M'Cracken, the trader whom we found here, set out to-day on his return to the British fort and factory on the Assiniboin river, about one hundred and fifty miles from this place. He took a letter from Captain Lewis to the North-west company, enclosing a copy of the passport granted by the British minister in the United States. At ten o'clock the chiefs of the lower village arrived; they requested that we would call at their village for some corn; that they were willing to make peace with the Ricaras; that they had never provoked the war between

them, but as the Ricaras had killed some of their chiefs, they had retaliated on them; that they had killed them like birds, till they were tired of killing them, so that they would send a chief and some warriors to smoke with them. In the evening we dropped down to the lower village, where Captain Lewis went on shore, and Captain Clarke proceeded to a point of wood on the north side.

Friday, November 2. He therefore went up to the village, where eleven bushels of corn were presented to him. In the meantime Captain Clarke went down with the boats three miles, and having found a good position where there was plenty of timber, encamped and began to fell trees to build our huts. Our Ricara chief set out with one Mandan chief and several Minnetaree and Mandan warriors; the wind was from the south-east, and the weather being fine, a crowd of Indians came down to visit us.

Saturday, 3. We now began the building of our cabins, and the Frenchmen who are to return to St. Louis, are building a perioque for the purpose. We sent six men in a perioque to hunt down the river. We were also fortunate enough to engage in our service, a Canadian Frenchman, who had been with the Chayenne Indians on the Black mountains, and last Summer descended thence by the little Missouri. Mr. Jesseaume, our interpreter, also came down with his squaw and children to live at our camp. In the evening we received a visit from Kagohami or little Raven, whose wife ac-

accompanied him, bringing about sixty weight of dried meat, a robe, and a pot of meal. We gave him in return, a piece of tobacco, to his wife an axe and a few small articles, and both of them spent the night at our camp. Two beavers were caught in traps this morning.

Sunday, 4. We continued our labours: the timber which we employ is large and heavy, and chiefly consists of cotton-wood and elm, with some ash of an inferior size. Great numbers of the Indians pass our camp on their hunting excursions: the day was clear and pleasant, but last night was very cold, and there was a white frost.

Monday, 5. The Indians are all out on their hunting parties: a camp of Mandans caught within two days, one hundred goats a short distance below us: their mode of hunting them is to form a large strong pen or fold, from which a fence made of bushes gradually widens on each side: the animals are surrounded by the hunters and gently driven towards this pen, in which they imperceptibly find themselves enclosed, and are then at the mercy of the hunters. The weather is cloudy, and the wind moderate from the north-west. Late at night we were awaked by the sergeant on guard, to see the beautiful phenomenon called the northern light: along the northern sky was a large space occupied by a light of a pale but brilliant white colour, which rising from the horizon, extended itself to nearly twenty degrees above it. After glittering for some time its colours would be overcast, and

almost obscured, but again it would burst out with renewed beauty; the uniform colour was pale light, but its shapes were various and fantastic: at times the sky was lined with light coloured streaks rising perpendicularly from the horizon, and gradually expanding into a body of light, in which we could trace the floating columns sometimes advancing, sometimes retreating and shaping into infinite forms, the space in which they moved. It all faded away before the morning. At day-light,

Tuesday, 6, the clouds to the north were darkening, and the wind rose high from the north-west at eight o'clock, and continued cold during the day. Mr. Gravelines and four others who came with us, returned to the Ricaras in a small periouque; we gave him directions to accompany some of the Ricara chiefs to the seat of government in the spring.

Wednesday, 7. The day was temperate, but cloudy and foggy, and we were enabled to go on with our work with much expedition.

Thursday, 8. The morning again cloudy; our huts advance very well, and we are visited by numbers of Indians who come to let their horses graze near us: in the day the horses are let loose in quest of grass; in the night they are collected and receive an armful of small boughs of the cotton-wood, which being very juicy, soft, and brittle, form nutritious and agreeable food: the frost this morning was very severe, the weather during the day cloudy, and the wind from the north-west.

We procured from an Indian, a weasel perfectly white, except the extremity of the tail which was black: great numbers of wild geese are passing to the south, but their flight is too high for us to procure any of them.

November 10. We had again a raw day, a north-west wind, but rose early in hopes of finishing our works before the extreme cold begins. A chief who is a half Pawnee came to us, and brought a present of half a buffaloe, in return for which we gave him some small presents and a few articles to his wife and son: he then crossed the river in a buffaloe skin canoe; his wife took the boat on her back and carried it to the village three miles off. Large flocks of geese and brant, and also a few ducks are passing towards the south.

Sunday, 11. The weather is cold. We received the visit of two squaws, prisoners from the Rock mountains, and purchased by Chaboneau. The Mandans at this time are out hunting the buffaloe.

Monday, 12. The last night had been cold and this morning we had a very hard frost: the wind changeable during the day, and some ice appears on the edges of the rivers; swans too are passing to the south. The Big White came down to us, having packed on the back of his squaw about one hundred pounds of very fine meat: for which we gave him, as well as the squaw, some presents, particularly an axe to the woman with which she was very much pleased.

Tuesday, 13. We this morning unloaded the

boat, and stowed away the contents in a storehouse which we have built. At half-past ten ice began to float down the river for the first time: in the course of the morning we were visited by the Black Cat, Poscapsahe, who brought an Assiniboin chief and seven warriors to see us. This man, whose name is Chechawk, is a chief of one out of three bands of Assiniboins who wander over the plains between the Missouri and Assiniboin during the summer, and in the winter carry the spoils of their hunting to the traders on the Assiniboin river, and occasionally come to this place: the whole three bands consist of about eight hundred men. We gave him a twist of tobacco to smoke with his people, and a gold cord for himself: the Sioux also asked for whiskey, which we refused to give them. It snowed all day and the air was very cold.

Wednesday, 14. The river rose last night half an inch, and is now filled with floating ice. This morning was cloudy with some snow: about seventy lodges of Assiniboins and some Knistenaux are at the Mandan village, and this being the day of adoption and exchange of property between them all, it is accompanied by a dance, which prevents our seeing more than two Indians to-day: these Knistenaux are a band of Chippeways whose language they speak; they live on the Assiniboin and Saskashawan rivers, and are about two hundred and forty men. We sent a man down on horseback to see what had become of our hunters, and

as we apprehend a failure of provisions we have recourse to our pork this evening. Two Frenchmen who had been below returned with twenty beaver, which they had caught in traps.

Thursday, 15. The morning again cloudy, and the ice running thicker than yesterday, the wind variable. The man came back with information that our hunters were about thirty miles below, and we immediately sent an order to them to make their way through the floating ice, to assist them in which we sent some tin for the bow of the *perioque* and a towrope. The ceremony of yesterday seems to continue still, for we were not visited by a single Indian. The swan are still passing to the south.

Friday, 16. We had a very hard white frost this morning, the trees are all covered with ice, and the weather cloudy. The men this day moved into the huts, although they are not finished. In the evening some horses were sent down to the woods near us, in order to prevent their being stolen by the Assiniboin, with whom some difficulty is now apprehended. An Indian came down with four buffaloe robes and some corn, which he offered for a pistol, but was refused.

Saturday, November 17. Last night was very cold, and the ice in the river to-day is thicker than hitherto. We are totally occupied with our huts, but received visits from several Indians.

Sunday, November 18. To-day we had a cold windy morning; the Black Cat came to see us,

and occupied us for a long time with questions on the usages of our country. He mentioned that a council had been held yesterday to deliberate on the state of their affairs. It seems that not long ago, a party of Sioux fell in with some horses belonging to the Minnetarees, and carried them off; but in their flight they were met by some Assiniboin, who killed the Sioux and kept the horses: a Frenchman too who had lived many years among the Mandans, was lately killed on his route to the British factory on the Assiniboin; some smaller differences existed between the two nations, all of which being discussed, the council decided that they would not resent the recent insults from the Assiniboin and Knistenaux, until they had seen whether we had deceived them or not in our promises of furnishing them with arms and ammunition. They had been disappointed in their hopes of receiving them from Mr. Evans, and were afraid that we too, like him, might tell them what was not true. We advised them to continue at peace, that supplies of every kind would no doubt arrive for them, but that time was necessary to organize the trade. The fact is, that the Assiniboin treat the Mandans as the Sioux do the Ricaras; by their vicinity to the British they get all the supplies, which they withhold or give at pleasure to the remoter Indians: the consequence is, that however badly treated, the Mandans and Ricaras are very slow to retaliate, lest they should lose their trade altogether.

Monday, 19. The ice continues to float in the river, the wind high from the north-west, and the weather cold. Our hunters arrived from their excursion below, and bring a very fine supply of thirty-two deer, eleven elk, and five buffaloe, all of which was hung in a smoke-house.

Tuesday 20. We this day moved into our huts, which are now completed. This place, which we call Fort Mandan, is situated in a point of low ground, on the north side of the Missouri, covered with tall and heavy cottonwood. The works consist of two rows of huts or sheds, forming an angle where they joined each other; each row containing four rooms, of fourteen feet square, and seven feet high, with plank ceiling, and the roof slanting so as to form a loft above the rooms, the highest part of which is eighteen feet from the ground: the backs of the huts formed a wall of that height, and opposite the angle the place of the wall was supplied by picketing: in the area were two rooms for stores and provisions. The latitude by observation is $47^{\circ} 21' 47''$, and the computed distance from the mouth of the Missouri, sixteen hundred miles.

In the course of the day several Indians came down to partake of our fresh meat; among the rest, three chiefs of the second Mandan village. They inform us that the Sioux on the Missouri above the Chayenne river, threaten to attack them this winter; that these Sioux are much irritated at the Ricaras for having made peace through our

means with the Mandans, and have lately ill treated three Ricaras who carried the pipe of peace to them, by beating them and taking away their horses. We gave them assurances that we would protect them from all their enemies.

November 21st. The weather was this day fine: the river clear of ice and rising a little; we are now settled in our new winter habitation, and shall wait with much anxiety the first return of spring to continue our journey.

The villages near which we are established are five in number, and are the residence of three distinct nations: the Mandans, the Ahnahaways, and the Minnetarees. The history of the Mandans, as we received it from our interpreters and from the chiefs themselves, and as it is attested by existing monuments, illustrates, more than that of any other nation, the unsteady movements and the tottering fortunes of the American nations. Within the recollection of living witnesses, the Mandans were settled forty years ago in nine villages, the ruins of which we passed about eighty miles below, and situated seven on the west and two on the east side of the Missouri. The two finding themselves wasting away before the small-pox and the Sioux, united into one village, and moved up the river opposite to the Ricaras. The same causes reduced the remaining seven to five villages, till at length they emigrated in a body to the Ricara nation, where they formed themselves into two villages, and joined those of their countrymen who had

gone before them. In their new residence they were still insecure, and at length the three villages ascended the Missouri to their present position. The two who had emigrated together still settled in the two villages on the north-west side of the Missouri, while the single village took a position on the south-east side. In this situation they were found by those who visited them in 1796; since which the two villages have united into one. They are now in two villages, one on the south-east of the Missouri, the other on the opposite side, and at the distance of three miles across. The first, in an open plain, contains about forty or fifty lodges, built in the same way as those of the Ricaras: the second, the same number, and both may raise about three hundred and fifty men.

On the same side of the river, and at the distance of four miles from the lower Mandan village, is another called Mahaha. It is situated on a high plain at the mouth of Knife river, and is the residence of the Ahnahaways. This nation, whose name indicates that they were "people whose village is on a hill," formerly resided on the Missouri, about thirty miles below where they now live. The Assiniboin and Sioux forced them to a spot five miles higher, where the greatest part of them were put to death, and the rest emigrated to their present situation, in order to obtain an asylum near the Minnetarees. They are called by the French, Soulier Noir or Shoe Indians; by the Mandans, Wattasoons, and their whole force is about fifty men.

On the south side of the same Knife river, half a mile above the Mahaha, and in the same open plain with it, is a village of Minnetarees surnamed Metaharta, who are about one hundred and fifty men in number. On the opposite side of Knife river, and one and a half mile above this village, is a second of Minnetarees, who may be considered as the proper Minnetaree nation. It is situated in a beautiful low plain, and contains four hundred and fifty warriors. The accounts which we received of the Minnetarees were contradictory. The Mandans say that this people came out of the water to the east, and settled near them in their former establishment, in nine villages; that they were very numerous, and fixed themselves in one village on the southern side of the Missouri. A quarrel about a buffalo divided the nation, of which two bands went into the plains, and were known by the name of Crow and Paunch Indians, and the rest moved to their present establishment. The Minnetarees proper assert, on the contrary, that they grew where they now live, and will never emigrate from the spot; the great spirit having declared that if they moved they would all die. They also say that the Minnetarees Metaharta, that is Minnetarees of the Willows, whose language with very little variation is their own, came many years ago from the plains and settled near them, and perhaps the two traditions may be reconciled by the natural presumption that these Minnetarees were the tribe known to the Mandans below, and

that they ascended the river for the purpose of rejoining the Minnetarees proper. These Minnetarees are part of the great nation called Fall Indians, who occupy the intermediate country between the Missouri and the Saskaskawan, and who are known by the name of Minnetarees of the Missouri, and Minnetarees of Fort de Prairie; that is, residing near or rather frequenting the establishment in the prairie on the Saskaskawan. These Minnetarees indeed, told us that they had relations on the Saskaskawan, whom they had never known till they met them in war, and having engaged in the night, were astonished at discovering that they were fighting with men who spoke their own language. The name of Grosventres, or Bigbellies is given to these Minnetarees, as well as to all the Fall Indians. The inhabitants of these five villages, all of which are within the distance of six miles, live in harmony with each other. The Ahnaways understand in part the language of the Minnetarees: the dialect of the Mandans differs widely from both; but their long residence together has insensibly blended their manners, and occasioned some approximation in language, particularly as to objects of daily occurrence and obvious to the senses.

November, 22. The morning was fine, and the day warm. We purchased from the Mandans a quantity of corn of a mixed colour, which they dug up in ears from holes made near the front of their lodges, in which it is buried during the winter.

This morning the sentinel informed us that an Indian was about to kill his wife near the fort; we went down to the house of our interpreter where we found the parties, and after forbidding any violence, inquired into the cause of his intending to commit such an atrocity. It appeared that some days ago a quarrel had taken place between him and his wife, in consequence of which she had taken refuge in the house where the two squaws of our interpreter lived: by running away she forfeited her life, which might have been lawfully taken by the husband. About two days ago she had returned to the village, but the same evening came back to the fort much beaten and stabbed in three places, and the husband now came for the purpose of completing his revenge. He observed that he had lent her to one of our sergeants for a night, and that if he wanted her he would give her to him altogether: we gave him a few presents and tried to persuade him to take his wife home; the grand chief too happened to arrive at the same moment, and reproached him with his violence, till at length they went off together, but by no means in a state of much apparent love.

November 23. Again we had a fair and warm day, with the wind from the south-east: the river is now at a stand, having risen four inches in the whole.

November 24. The wind continued from the same quarter and the weather was warm: we were occupied in finishing our huts and making a large rope of elk-skin to draw our boat on the bank.

Sunday, November 25. The weather is still fine, warm and pleasant, and the river falls one inch and a half. Captain Lewis went on an excursion to the villages accompanied by eight men. A Minnetaree chief, the first who has visited us, came down to the fort: his name was Waukerassa, but as both the interpreters had gone with Captain Lewis we were obliged to confine our civilities to some presents, with which he was much pleased: we now completed our huts, and fortunately too, for the next day,

Monday, November 26, before daylight the wind shifted to the north-west, and blew very hard, with cloudy weather and a keen cold air, which confined us much and prevented us from working: the night continued very cold, and,

Tuesday, 27, the weather cloudy, the wind continuing from the north-west and the river crowded with floating ice. Captain Lewis returned with two chiefs, Mahnotah, an Ahnahaway, and Minnesurree, a Minnetaree, and a third warrior: they explained to us that the reason of their not having come to see us, was, that the Mandans had told them that we meant to combine with the Sioux and cut them off in the course of the winter: a suspicion increased by the strength of the fort, and the circumstance of our interpreters having both removed there with their families: these reports we did not fail to disprove to their entire satisfaction, and amused them by every attention, particularly by the dancing of the men, which diverted them

highly. All the Indians whom Captain Lewis had visited were very well disposed, and received him with great kindness, except a principal chief of one of the upper villages, named Mahpahparapassatoo or Horned Weasel, who made use of the civilized indecorum of refusing to be seen, and when Captain Lewis called, he was told the chief was not at home. In the course of the day seven of the North-west company's traders arrived from the Assiniboin river, and one of their interpreters having undertaken to circulate among the Indians unfavourable reports, it became necessary to warn them of the consequences, if they did not desist from such proceedings. The river fell two inches to-day and the weather became very cold.

Wednesday, 28. About eight o'clock last evening it began to snow, and continued till daybreak, after which it ceased till seven o'clock, but then resumed and continued during the day, the weather being cold and the river full of floating ice: about eight o'clock Poscopsahe came down to visit us, with some warriors; we gave them presents and entertained them with all that might amuse their curiosity, and at parting we told them that we had heard of the British trader, Mr. Laroche, having attempted to distribute medals and flags among them; but that those emblems could not be received from any other than the American nation, without incurring the displeasure of their great father, the president. They left us much pleased

with their treatment. The river fell one inch to-day.

Thursday, 29. The wind is again from the north-west, the weather cold, and the snow which fell yesterday and last night is thirteen inches in depth. The river closed during the night at the village above, and fell two feet; but this afternoon it began to rise a little. Mr. Laroche, the principal of the seven traders, came with one of his men to see us; we told him that we should not permit him to give medals and flags to the Indians; he declared that he had no such intention, and we then suffered him to make use of one of our interpreters, on his stipulating not to touch any subject but that of his traffic with them. An unfortunate accident occurred to Sergeant Pryor, who in taking down the boat's mast dislocated his shoulder, nor was it till after four trials that we replaced it.

Friday, 30. About eight o'clock an Indian came to the opposite bank of the river, calling out that he had something important to communicate, and on sending for him, he told us that five Mandans had been met about eight leagues to the south-west by a party of Sioux, who had killed one of them, wounded two, and taken nine horses; that four of the Wattasoons were missing, and that the Mandans expected an attack. We thought this an excellent opportunity to discountenance the injurious reports against us, and to fix the wavering confidence of the nation. Captain Clarke therefore instantly crossed the river

with twenty-three men strongly armed, and circling the town, approached it from behind. His unexpected appearance surprised and alarmed the chiefs, who came out to meet him, and conducted him to the village. He then told them that having heard of the outrage just committed, he had come to assist his dutiful children; that if they would assemble their warriors and those of the nation, he would lead them against the Sioux and avenge the blood of their countrymen. After some minutes conversation, Ohenaw the Chayenne arose; "We now see," said he, "that what you have told us is true, since as soon as our enemies threaten to attack us you come to protect us and are ready to chastise those who have spilt our blood. We did indeed listen to your good talk, for when you told us that the other nations were inclined to peace with us, we went out carelessly in small parties, and some have been killed by the Sioux and Ricaras. But I knew that the Ricaras were liars, and I told their chief who accompanied you, that his whole nation were liars and bad men; that we had several times made a peace with them, which they were the first to break; that whenever we pleased we might shoot them like buffaloe, but that we had no wish to kill them; that we would not suffer them to kill us, nor steal our horses; and that although we agree to make peace with them, because our two fathers desired it, yet we did not believe that they would be faithful long. Such,

father, was my language to them in your presence, and you see that instead of listening to your good counsels they have spilt our blood. A few days ago, two Ricaras came here and told us that two of their villages were making moccasins, that the Sioux were stirring them up against us, and that we ought to take care of our horses; yet these very Ricaras we sent home as soon as the news reached us to-day, lest our people should kill them in the first moment of grief for their murdered relatives. Four of the Wattasoons whom we expected back in sixteen days have been absent twenty-four, and we fear have fallen. But, father, the snow is now deep, the weather cold, and our horses cannot travel through the plains: the murderers have gone off: if you will conduct us in the spring, when the snow has disappeared, we will assemble all the surrounding warriors, and follow you."

Captain Clarke replied, that we were always willing and able to defend them; that he was sorry that the snow prevented their marching to meet the Sioux, since he wished to show them that the warriors of their great father would chastise the enemies of his obedient children who opened their ears to his advice; that if some Ricaras had joined the Sioux, they should remember that there were bad men in every nation, and that they should not be offended at the Ricaras till they saw whether these ill-disposed men

were countenanced by the whole tribe; that the Sioux possessed great influence over the Ricaras, whom they supplied with military stores, and sometimes led them astray, because they were the afraid to oppose them: but that this should be the less offensive, since the Mandans themselves were under the same apprehensions from the Assiniboins and Knistenaux, and that while they were thus dependant, both the Ricaras and Mandans ought to keep on terms with their powerful neighbours, whom they may afterwards set at defiance, when we shall supply them with arms, and take them under our protection.

After two hours conversation Captain Clarke left the village. The chief repeatedly thanked him for the fatherly protection he had given them, observing that the whole village had been weeping all night and day for the brave young man who had been slain, but now they would wipe their eyes and weep no more as they saw that their father would protect them. He then crossed the river on the ice and returned on the north side to the fort. The day as well as the evening was cold, and the river rose to its former height.

Saturday, December 1. The wind was from the north-west, and the whole party engaged in picketing the fort. About ten o'clock the half-brother of the man who had been killed, came to inform us that six Sharhas or Chayenne Indians had arrived, bringing a pipe of peace, and that their nation was three days march behind them. Three Pawnees

had accompanied the Sharhas, and the Mandans being afraid of the Sharhas on account of their being at peace with the Sioux, wished to put both them and the three Pawnees to death; but the chiefs had forbidden it, as it would be contrary to our wishes. We gave him a present of tobacco, and although from his connexion with the sufferer, he was more embittered against the Pawnees than any other Mandan, yet he seemed perfectly satisfied with our pacific councils and advice. The Mandans, we observe, call all the Ricaras by the name of Pawnees; the name of Ricaras being that by which the nation distinguishes itself.

In the evening we were visited by a Mr. Henderson, who came from the Hudson Bay Company to trade with the Minnetarees. He had been about eight days on his route in a direction nearly south, and brought with him tobacco, beads, and other merchandize, to trade for furs, and a few guns, which are to be exchanged for horses.

Sunday, December 2. The latter part of the evening was warm, and a thaw continued till the morning, when the wind shifted to the north. At eleven o'clock the chiefs of the lower village brought down four of the Sharhas. We explained to them our intentions, and advised them to remain at peace with each other: we also gave them a flag, some tobacco, and a speech for their nation. These were accompanied by a letter to Messrs. Tabeau and Gravelines at the Ricara village, requesting them to preserve peace if possible, and to declare

the part which we should be forced to take if the Ricaras and Sioux made war on those whom we had adopted. After distributing a few presents to the Sharhas and Mandans, and shewing them our curiosities, we dismissed them, apparently well pleased at their reception.

Monday, December 3. The morning was fine, but in the afternoon the weather became cold, with the wind from the north-west. The father of the Mandan who was killed brought us a present of dried pumpkins and some pemitigon, for which we gave him some small articles. Our offer of assistance to avenge the death of his son seemed to have produced a grateful respect from him, as well as from the brother of the deceased, which pleased us much.

Tuesday, 4th. The wind continues from the north-west, the weather cloudy and raw, and the river rose one inch. Oscapsahe and two young chiefs pass the day with us. The whole religion of the Mandans consists in the belief of one great spirit presiding over their destinies. This being must be in the nature of a good genius, since it is associated with the healing art, and the great spirit is synonymous with great medicine, a name also applied to every thing which they do not understand. Each individual selects for himself the particular object of his devotion, which is termed his medicine, and is either some invisible being or more commonly some animal, which thenceforward becomes his protector or his inter-

cessor with the great spirit; to propitiate whom every attention is lavished, and every personal consideration is sacrificed. "I was lately owner of seventeen horses," said a Mandan to us one day, "but I have offered them all up to my medicine, and am now poor." He had in reality taken all his wealth, his horses, into the plain, and turning them loose, committed them to the care of his medicine, and abandoned them for ever. The horses, less religious, took care of themselves, and the pious votary travelled home on foot. Their belief in a future state is connected with this tradition of their origin: the whole nation resided in one large village under ground, near a subterraneous lake; a grape vine extended its roots down to their habitation, and gave them a view of the light: some of the most adventurous climbed up the vine, and were delighted with the sight of the earth, which they found covered with buffaloe and rich with every kind of fruits: returning with the grapes they had gathered, their countrymen were so pleased with the taste of them that the whole nation resolved to leave their dull residence for the charms of the upper region: men, women, and children ascended by means of the vine; but when about half the nation had reached the surface of the earth, a corpulent woman, who was clambering up the vine, broke it with her weight, and closed upon herself and the rest of the nation the light of the sun. Those who were left on earth made a village below, where we saw the nine villages;

and when the Mandans die they expect to return to the original seats of their forefathers; the good reaching the ancient village by means of the lake, which the burdens of the sins of the wicked will not enable them to cross.

Wednesday, 5. The morning was cold and disagreeable, the wind from the south-east, accompanied with snow: in the evening there was snow again and the wind shifted to the north-east: we were visited by several Indians with a present of pumpkins, and by two of the traders of the North-west company.

Thursday, 6. The wind was violent from the north north-west with some snow, the air keen and cold. At eight o'clock A. M. the thermometer stood at ten degrees above 0, and the river rose an inch and an half in the course of the day.

Friday, December 7. The wind still continued from the north-west, and the day is very cold: Shakhaka, the chief of the lower village, came to apprise us that the buffaloe were near, and that his people were waiting for us to join them in the chase: Captain Clarke with fifteen men went out and found the Indians engaged in killing the buffaloe, the hunters mounted on horseback and armed with bows and arrows encircle the herd, and gradually drive them into a plain or an open place fit for the movements of horse; they then ride in among them, and singling out a buffaloe, a female being preferred, go as close as possible and wound her with arrows till they think they have given the

mortal stroke; when they pursue another till the quiver is exhausted: if, which rarely happens, the wounded buffalo attacks the hunter, he evades his blow by the agility of his horse, which is trained for the combat with great dexterity. When they have killed the requisite number they collect their game, and the squaws and attendants come up from the rear and skin and dress the animals. Captain Clarke killed ten buffalo, of which only five were brought to the fort, the rest, which could not be conveyed home, being seized by the Indians, among whom the custom is, that whenever a buffalo is found dead without an arrow, or any particular mark, he is the property of the finder; so that often a hunter secures scarcely any of the game he kills, if the arrow happens to fall off: whatever is left out at night falls to the share of the wolves, who are the constant and numerous attendants of the buffalo. The river closed opposite the fort last night, an inch and a half in thickness. In the morning the thermometer stood at one degree below 0. Three men were badly frost-bitten in consequence of their exposure.

Saturday, 8. The thermometer stood at twelve degrees below 0, that is at forty-two degrees below the freezing point: the wind was from the northwest. Captain Lewis with fifteen men went out to hunt the buffalo; great numbers of which darkened the prairies for a considerable distance: they did not return till after dark, having killed eight

buffalo and one deer. The hunt was however, very fatiguing, as they were obliged to make a circuit at the distance of more than seven miles: the cold too, was so excessive that the air was filled with icy particles resembling a fog, and the snow generally six or eight inches deep, and sometimes eighteen, in consequence of which two of the party were hurt by falls, and several had their feet frost-bitten.

Sunday, 9. The wind was this day from the east, the thermometer at seven degrees above 0, and the sun shone clear: two chiefs visited us, one in a sledge drawn by a dog and loaded with meat.

Monday, 10. Captain Clarke who had gone out yesterday with eighteen men to bring in the meat we had killed the day before, and to continue the hunt, came in at twelve o'clock. After killing nine buffalo and preparing that already dead, he had spent a cold disagreeable night on the snow, with no covering but a small blanket, sheltered by the hides of the buffalo they had killed. We observe large herds of buffalo crossing the river on the ice; the men who were frostbitten are recovering, but the weather is still exceedingly cold, the wind being from the north, and the thermometer at ten and eleven degrees below 0: the rise of the river is one inch and a half.

Tuesday, 11. The weather became so intensely cold that we sent for all the hunters who had remained out with Captain Clarke's party, and they returned in the evening several of them frostbitten.

The wind was from the north and the thermometer at sunrise stood at twenty-one below 0, the ice in the atmosphere being so thick as to render the weather hazy and give the appearance of two suns reflecting each other. The river continues at a stand. Pocapsahe made us a visit to-day.

Wednesday, December 12. The wind is still from the north, the thermometer being at sunrise thirty-eight degrees below 0. One of the Ahnaha-ways brought us down the half of an antelope killed near the fort; we had been informed that all these animals return to the Black mountains, but there are great numbers of them about us at this season which we might easily kill, but are unwilling to venture out before our constitutions are hardened gradually to the climate. We measured the river on the ice, and find it five hundred yards wide immediately opposite the fort.

Thursday, 13. Last night was clear and a very heavy frost covered the old snow, the thermometer at sunrise being twenty degrees below 0, and followed by a fine day. The river falls.

Friday, 14. The morning was fine, and the weather having moderated so far that the mercury stood at 0, Captain Lewis went down with a party to hunt; they proceeded about eighteen miles, but the buffaloe having left the banks of the river they saw only two, which were so poor as not to be worth killing, and shot two deer. Notwithstanding the snow we were visited by a large number of the Mandans.

Saturday, 15. Captain Lewis, finding no game, returned to the fort hunting on both sides the river, but with no success. The wind being from the north, the mercury at sun-rise eight below 0, and the snow of last night an inch and a half in depth. The Indian chiefs continue to visit us to-day with presents of meat.

Sunday, 16. The morning is clear and cold, the mercury at sun-rise 22° below 0. A Mr. Haney with two other persons from the British establishment on the Assiniboin, arrived in six days with a letter from Mr. Charles Chabouilles, one of the company, who with much politeness offered to render us any service in his power.

Monday, 17. The weather to-day was colder than any we had yet experienced, the thermometer at sun-rise being 45° below 0, and about eight o'clock it fell to 74° below freezing point. From Mr. Haney, who is a very sensible intelligent man, we obtained much geographical information with regard to the country between the Missouri and Mississippi, and the various tribes of Sioux who inhabit it.

Tuesday, 18. The thermometer at sun-rise was 32° below 0. The Indians had invited us yesterday to join their chace to-day, but the seven men whom we sent, returned in consequence of the cold, which was so severe last night, that we were obliged to have the centinel relieved every half hour. The north-west traders, however, left us on their return home.

Wednesday, 19. The weather moderated, and the river rose a little, so that we were enabled to continue the picketing of the fort. Notwithstanding the extreme cold, we observe the Indians at the village engaged out in the open air, at a game which resembled billiards more than any thing we had seen, and which we are inclined to suspect may have been acquired by ancient intercourse with the French of Canada. From the first to the second chief's lodge, a distance of about fifty yards, was covered with timber, smoothed and joined so as to be as level as the floor of one of our houses, with a battery at the end to stop the rings: these rings were of clay-stone, and flat like the chequers for drafts, and the sticks were about four feet long, with two short pieces at one end in the form of a mace, so fixed, that the whole will slide along the board. Two men fix themselves at one end, each provided with a stick, and one of them with a ring; they then run along the board, and about half way slide the sticks after the ring.

Thursday, 20. The wind was from the N. W. the weather moderate, the thermometer 24° above 0 at sun-rise. We availed ourselves of this change to picket the fort near the river.

Friday, 21. The day was fine and warm, the wind N. W. by W. The Indian who had been prevented a few days ago from killing his wife, came with both his wives to the fort, and was very desirous of reconciling our interpreter, a jealousy against whom, on account of his wife's taking

refuge in his house, had been the cause of his animosity. A woman brought her child with an abscess in the lower part of the back, and offered as much corn as she could carry for some medicine; we administered to it of course very cheerfully.

Saturday, 22d. A number of squaws and men dressed like squaws brought corn to trade for small articles with the men. Among other things we procured two horns of the animal called by the French, the Rock mountain sheep, and known to the Mandans by the name of ahsahta. The animal itself is about the size of a small elk or large deer: the horns winding like those of a ram, which they resemble also in texture, though larger and thicker.

Sunday, 23d. The weather was fine and warm like that of yesterday: we were again visited by crowds of Indians of all descriptions, who came either to trade, or from mere curiosity. Among the rest Kogahami, the Little Raven, brought his wife and son loaded with corn, and she then entertained us with a favourite Mandan dish, a mixture of pumpkins, beans, corn, and chokecherries with the stones, all boiled together in a kettle, and forming a composition by no means unpalatable.

Monday, 24th. The day continued warm and pleasant, and the number of visitors became troublesome. As a present to three of the chiefs, we divided a fillet of sheepskin which we brought for spunging into three pieces, each of two inches in

width; they were delighted at the gift, which they deemed of equal value with a fine horse. We this day completed our fort, and the next morning being Christmas,

Tuesday, 25th, we were awakened before day by a discharge of three platoons from the party. We had told the Indians not to visit us, as it was one of our great medicine days; so that the men remained at home and amused themselves in various ways, particularly with dancing, in which they take great pleasure. The American flag was hoisted for the first time in the fort; the best provisions we had were brought out, and this, with a little brandy, enabled them to pass the day in great festivity.

Wednesday, 26th. The weather is again temperate, but no Indians have come to see us. One of the north-west traders who came down to request the aid of our Minnetaree interpreter, informs us, that a party of Minnetarees who had gone in pursuit of the Assiniboin who had lately stole their horses, had just returned. As is their custom, they come back in small detachments, the last of which brought home eight horses which they had captured or stolen from an Assiniboin camp, on Mouse river.

Thursday, 27th. A little fine snow fell this morning, and the air was colder than yesterday, with a high north-west wind. We were fortunate enough to have among our men a good blacksmith, whom we set to work to make a variety of articles:

his operations seemed to surprise the Indians who came to see us, but nothing could equal their astonishment at the bellows, which they considered as a very great medicine. Having heretofore promised a more particular account of the Sioux, the following may serve as a general outline of their history:

Almost the whole of that vast track of country comprised between the Mississippi, the Red river of Lake Winnepeg, the Saskaskawan, and the Missouri, is loosely occupied by a great nation whose primitive name is Darcota, but who are called Sioux by the French, Sues by the English. Their original seats were on the Mississippi, but they have gradually spread themselves abroad and become subdivided into numerous tribes. Of these, what may be considered as the Darcotas, are the Mindawarcanton, or Minowakanton, known to the French by the name of the Gens du Lac, or People of the Lake. Their residence is on both sides of the Mississippi, near the falls of St. Anthony, and the probable number of their warriors about three hundred. Above them, on the river St. Peter's, is the Wahpatone, a smaller band of nearly two hundred men; and still further up the same river below Yellow-wood river are the Wahpatootas, or Gens de Feuilles, an inferior band of not more than one hundred men; while the sources of the St. Peter's are occupied by the Sisatoones, a band consisting of about two hundred warriors.

These bands rarely if ever approach the Missouri,

which is occupied by their kinsmen the Yanktons and the Tetons. The Yanktons are of two tribes, those of the plains, or rather of the north, a wandering race of about five hundred men, who roam over the plains at the heads of the Jaques, the Sioux, and the Red river; and those of the south who possess the country between the Jaques and Sioux rivers, and the Desmoines. But the bands of Sioux most known on the Missouri are the Tetons. The first who are met on ascending the Missouri, is the tribe called by the French, the Tetons of the Bois Brule, of Burntwood, who reside on both sides of the Missouri, about White and Teton rivers, and number two hundred warriors. Above them on the Missouri are the Teton Okandandas, a band of one hundred and fifty men, living below the Chayenne river, between which and the Wetarhoo river is a third band, called Teton Minnakenozzo, of nearly two hundred and fifty men; and below the Warreconne is the fourth and last tribe of Tetons of about three hundred men, and called Teton Saone. Northward of these, between the Assiniboin and the Missouri, are two bands of Assiniboins, one on Mouse river of about two hundred men, and called Assiniboin Menatopa; the other, residing on both sides of White river, called by the French Gens de Feuilles, and amounting to two hundred and fifty men. Beyond these a band of Assiniboins of four hundred and fifty men, and called the Big Devils, wander on the heads of Milk, Porcupine, and Martha's rivers; while still

farther to the north are seen two bands of the same nation, one of five hundred and [the other of two hundred, roving on the Saskaskawan. Those Assiniboins are recognised by a similarity of language, and by tradition as descendants or seceders from the Sioux; though often at war are still acknowledged as relations. The Sioux themselves, though scattered, meet annually on the Jaques, those on the Missouri trading with those on the Mississippi.

 TER OF THE MISSOURI, OF THE SURROUNDING COUN-
 TRY, AND OF THE RIVERS, CREEKS, ISLANDS, &c.

FRIDAY, 28th. The wind continued high last night, the frost severe, and the snow drifting in great quantities through the plains.

Saturday, 29. There was a frost fell last night nearly one quarter of an inch in depth, which continued to fall till the sun had gained some height: the mercury at sunrise stood at 9° below 0: there were a number of Indians at the fort in the course of the day.

Sunday, 30. The weather was cold, and the thermometer 20° below 0. We killed one deer, and yesterday one of the men shot a wolf. The Indians brought corn, beans, and squashes, which

they very readily gave for getting their axes and kettles mended. In their general conduct during these visits they are honest, but will occasionally pilfer any small article.

Monday, 31. During the night there was a high wind which covered the ice with hillocks of mixed sand and snow: the day was however fine, and the Indians came in great numbers for the purpose of having their utensils repaired.

Tuesday, January 1, 1805. The new year was welcomed by two shot from the swivel, and a round of small arms. The weather was cloudy but moderate; the mercury which at sunrise was at 18° , in the course of the day rose to 34° above 0: towards evening it began to rain, and at night we had snow, the temperature for which is about 0. In the morning we permitted sixteen men with their music to go up to the first village, where they delighted the whole tribe with their dances, particularly with the movements of one of the Frenchmen who danced on his head. In return they presented the dancers with several buffaloe robes and quantities of corn. We were desirous of shewing this attention to the village, because they had received an impression that we had been wanting in regard for them, and because they had in consequence circulated invidious comparisons between us and the northern traders: all these however they declared to Captain Clarke, who visited them in the course of the morning, were made in jest. As Captain Clarke was about leaving the village, two of their chiefs re-

turned from a mission to the Grosventres or wandering Minnetarees. These people were encamped about ten miles above, and while there, one of the Ahnahaways had stolen a Minnetaree girl: the whole nation immediately espoused the quarrel, and one hundred and fifty of their warriors were marching down to revenge the insult on the Ahnahaways. The chief of that nation took the girl from the ravisher, and giving her to the Mandans requested their intercession. The messengers went out to meet the warriors, and delivered the young damsel into the hands of her countrymen, smoked the pipe of peace with them, and were fortunate enough to avert their indignation and induce them to return. In the evening some of the men came to the fort, and the rest slept in the village. Pocapsahe also visited us and brought some meat on his wife's back.

Wednesday, January 2. It snowed last night, and during this day the same scene of gaiety was renewed at the second village, and all the men returned in the evening.

Thursday, 3. Last night it became very cold, and this morning we had some snow: our hunters were sent out for buffaloe, but the game had been frightened from the river by the Indians, so that they obtained only one: they however killed a hare and a wolf. Among the Indians who visited us was a Minnetaree who came to seek his wife: she had been much abused and came here for protection, but returned with him, as we had no authority

to separate those whom even the Mandan rites had united.

Friday, 4. The morning was cloudy and warm, the mercury being 28° above 0: but towards evening the wind changed to north-west, and the weather became cold. We sent some hunters down the river, but they killed only one buffaloe, and a wolf. We received the visit of Kagohami who is very friendly, and to whom we gave a handkerchief and two files.

Saturday, 5. We had high and boisterous winds last night and this morning: the Indians continue to purchase repairs with grain of different kinds. In the first village there has been a buffaloe dance for the last three nights, which has put them all into commotion, and the description which we received from those of the party who visited the village, and from other sources, is not a little ludicrous. The buffaloe dance is an institution originally intended for the benefit of the old men, and practised at their suggestion. When buffaloe becomes scarce, they send a man to harangue the village, declaring that the game is far off and that a feast is necessary to bring it back, and if the village be disposed, a day and place is named for the celebration of it. At the appointed hour the old men arrive, and seat themselves crosslegged on skins round a fire in the middle of the lodge with a sort of doll or small image, dressed like a female, placed before them. The young men bring with them a platter of provisions, a pipe of tobacco, and

their wives, whose dress on the occasion is only a robe or mantle loosely thrown round the body. On their arrival each youth selects the old man whom he means to distinguish by his favour, and spreads before him the provisions, after which he presents the pipe and smokes with him. *Mox senex vir simulacrum parvæ puellæ ostensit. Tunc egrediens cætu, jecit effigium solo et superincumbens, senili ardore veneris complexit. Hoc est signum. Denique uxor e turba recessit, et jactu corporis, fovet amplexus viri solo recubante. Maritus appropinquans senex vir dejecto vultu, et honorem et dignitatem ejus conservare amplexu uxoris illum oravit. Forsitan imprimis ille refellit; dehinc, maritus multis precibus, multis lachrymis, et multis donis vehementer intercessit. Tunc senex amator perculsus misericordia, tot precibus, tot lachrymis, et tot donis, conjugali amplexu submisit. Multum ille jactatus est, sed debilis et effœtus senectute, frustra jactatus est. Maritus interdum stans juxta gaudit multum honore, et ejus dignitati sic conservata. Unus nostrum sodalium multum alacrior et potentior juventute, hac nocte honorem quatuor maritorum custodivit.*

Sunday, 6. A clear cold morning with high wind: we caught in a trap a large gray wolf, and last night obtained in the same way a fox who had for some time infested the neighbourhood of the fort. Only a few Indians visited us to-day.

Monday, 7. The weather was again clear and cold with a high north-west wind, and the ther-

mometer at sunrise 22° below 0: the river fell an inch. Shahaka the Big White chief dined with us, and gave a connected sketch of the country as far as the mountains.

Tuesday, 8. The wind was still from the north-west, the day cold, and we received few Indians at the fort. Besides the buffaloe dance we have just described, there is another called medicine dance, an entertainment given by any person desirous of doing honour to his medicine or genius. He announces, that on such a day he will sacrifice his horses, or other property, and invites the young females of the village to assist in rendering homage to his medicine; all the inhabitants may join in the solemnity, which is performed in the open plain and by daylight, but the dance is reserved for the virgins, or at least the unmarried females, who disdain the encumbrance or the ornament of dress. The feast is opened by devoting the goods of the master of the feast to his medicine, which is represented by a head of the animal itself, or by a medicine bag, if the deity be an invisible being. The young women then begin the dance, in the intervals of which each will prostrate herself before the assembly to challenge or reward the boldness of the youth, who are often tempted by feeling or the hopes of distinction to achieve the adventure.

Wednesday, 9. The weather is cold, the thermometer at sunrise 21° below 0. Kagohami breakfasted with us, and Captain Clarke, with three or four men, accompanied him and a party of Indians

to hunt, in which they were so fortunate as to kill a number of buffaloe: but they were incommoded by snow, by high and squally winds, and by extreme cold: several of the Indians came to the fort nearly frozen, others are missing, and we are uneasy for one of our men, who was separated from the rest during the chase, has not returned: In the morning,

Thursday, 10, however, he came back just as we were sending out five men in search of him. The night had been excessively cold, and this morning at sunrise the mercury stood at 40° below 0, or 72° below the freezing point. He had, however, made a fire and kept himself tolerably warm. A young Indian, about thirteen years of age, also came in soon after. His father who came last night to inquire after him very anxiously, had sent him in the afternoon to the fort: he was overtaken by the night, and was obliged to sleep on the snow with no covering except a pair of antelope skin moccasins and leggings, and a buffaloe robe: his feet being frozen we put them into cold water, and gave him every attention in our power. About the same time an Indian who had also been missing returned to the fort, and although his dress was very thin, and he had slept on the snow without a fire, he had not suffered the slightest inconvenience. We have indeed observed that these Indians support the rigours of the season in a way which we had hitherto thought impossible. A more pleasing reflection occurred at seeing the warm interest

which the situation of these two persons had excited in the village, the boy had been a prisoner and adopted from charity, yet the distress of the father proved that he felt for him the tenderest affection: the man was a person of no distinction, yet the whole village was full of anxiety for his safety, and when they came to us, borrowed a sleigh to bring them home with ease, if they survived, or to carry their bodies if they had perished.

Friday, 11. We dispatched three hunters to join the same number whom we had sent below about seven miles to hunt elk. Like that of yesterday, the weather to-day was cold and clear, the thermometer standing at 38° below 0. Poscopsahe and Shotahawrora visited us, and passed the night at the fort.

Saturday, 12. The weather continues very cold, the mercury at sunrise being 20° below 0. Three of the hunters returned, having killed three elk.

Sunday, 13. We have a continuation of clear weather, and the cold has increased, the mercury having sunk to 34° below 0. Nearly one-half of the Mandan nation passed down the river to hunt for several days; in these excursions, men, women, and children, with their dogs, all leave the village together, and after discovering a spot convenient for the game, fix their tents; all the family bear their part in the labour, and the game is equally divided among the families of the tribe. When a single hunter returns from the chase with more than is necessary for his own immediate consump-

tion, the neighbours are entitled by custom to a share of it: they do not however ask for it, but send a squaw, who, without saying any thing, sits down by the door of the lodge till the master understands the hint, and gives her gratuitously a part for her family. Chaboneau, who with one man had gone to some lodges of Minnetarees near the Turtle mountain, returned with their faces much frostbitten. They had been about ninety miles distant, and procured from the inhabitants some meat and grease, with which they loaded the horses. He informs us that the agent of the Hudson Bay Company at that place had been endeavouring to make unfavourable impressions with regard to us on the mind of the great chief, and that the N. W. Company intend building a fort there. The great chief had in consequence spoken slightly of the Americans, but said, that if we would give him our great flag he would come and see us.

Monday, 14. The Mandans continue to pass down the river on their hunting party, and were joined by six of our men. One of those sent on Thursday returned, with information that one of his companions had his feet so badly frostbitten that he could not walk home. In their excursion they had killed a buffaloe, a wolf, two porcupines, and a white hare. The weather was more moderate to-day, the mercury being at 16° below 0, and the wind from the S. E.; we had however some snow, after which it remained cloudy.

Tuesday, 15. The morning is much warmer than yesterday, and the snow begins to melt, though the wind, after being for some time from the S. E., suddenly shifted to N. W. Between twelve and three o'clock A. M. there was a total eclipse of the moon, from which we obtained a part of the observation necessary for ascertaining the longitude.

We were visited by four of the most distinguished men of the Minnetarees, to whom we shewed marked attentions, as we knew that they had been taught to entertain strong prejudices against us; these we succeeded so well in removing, that when in the morning,

Wednesday, 16, about thirty Mandans, among whom six were chiefs, came to see us; the Minnetarees reproached them with their falsehoods, declaring that they were bad men and ought to hide themselves. They had told the Minnetarees that we would kill them if they came to the fort, yet on the contrary they had spent a night there, and been treated with kindness by the whites, who had smoked with them and danced for their amusement. Kagohami visited us, and brought us a little corn; and soon afterwards one of the first war chiefs of the Minnetarees came, accompanied by his squaw, a handsome woman, whom he was desirous we should use during the night. He favoured us with a more acceptable present, a draft of the Missouri in his manner, and informed us of his intention to go to war in the spring against the Snake Indians;

we advised him to reflect seriously before he committed the peace of his nation to the hazards of war; to look back on the numerous nations whom war has destroyed; that if he wished his nation to be happy, he should cultivate peace and intercourse with all his neighbours, by which means they would procure more horses, and increase in numbers; and that if he went to war, he would displease his great father the president, and forfeit his protection. We added, that we had spoken thus to all the tribes whom we had met, that they had all opened their ears, and that the president would compel those who did not voluntarily listen to his advice. Although a young man of only twenty-six years of age, this discourse seemed to strike him. He observed, that if it would be displeasing to us he would not go to war, since he had horses enough, and that he would advise all the nation to remain at home, until we had seen the Snake Indians, and discovered whether their intentions were pacific. The party who went down with the horses for the man who was frostbitten returned, and we are glad to find his complaint not serious.

Thursday, 17. The day was very windy from the north; the morning clear and cold, the thermometer at sunrise being at 0: we had several Indians with us.

Friday, 18. The weather is fine and moderate. Messrs. Laroche and M. Kenzie, two of the N. W. Company's traders, visited us with some of the Minnetarees. In the afternoon, two of our

hunters returned, having killed four wolves and a blaireau.

Saturday, 19. Another cloudy day. The two traders set out on their return, and we sent two men with the horses thirty miles below to the hunting camp.

Sunday, 20. The day fair and cold. A number of Indians visit us with corn to exchange for articles, and to pay for repairs to their household utensils.

Monday, 21. The weather was fine and moderate. The hunters all returned, having killed during their absence three elk, four deer, two porcupines, a fox and a hare.

Tuesday, 22. The cold having moderated and the day pleasant, we attempted to cut the boats out of the ice, but at the distance of eight inches came to water, under which the ice became three feet thick, so that we were obliged to desist.

Wednesday, 23. The cold weather returned, the mercury having sunk 2° below 0, and the snow fell four inches deep.

Thursday, 24. The day was colder than any we have had lately, the thermometer being at 12° below 0. The hunters whom we sent out returned unsuccessful, and the rest were occupied in cutting wood to make charcoal.

Friday, 25. The thermometer was at 25° below 0, the wind from N. W. and the day fair, so that the men were employed in preparing coal, and cutting the boats out of the ice. A band of Assini-

boins headed by their chief, called by the French, Son of the Little Calf, have arrived at the villages.

Saturday, 26. A fine warm day: a number of Indians dine with us: and one of our men is attacked with a violent pleurisy.

Sunday, 27. Another warm and pleasant day: we again attempted to get the boat out of the ice. The man who has the pleurisy was blooded and sweated, and we were forced to take off the toes of the young Indian who was frost-bitten some time since. Our interpreter returned from the villages, bringing with him three of Mr. Laroche's horses which he had sent in order to keep them out of the way of the Assiniboin, who are very much disposed to steal, and who have just returned to their camp.

Monday, 28. The weather to-day is clear and cold: we are obliged to abandon the plan of cutting the boat through the ice, and therefore made another attempt the next day,

Tuesday, 29, by heating a quantity of stones so as to warm the water in the boat, and thaw the surrounding ice: but in this too we were disappointed, as all the stones on being put into the fire cracked into pieces: the weather warm and pleasant: the man with the pleurisy is recovering.

Wednesday, 30. The morning was fair, but afterwards became cloudy. Mr. Laroche the trader from the North-West Company paid us a visit, in hopes of being able to accompany us on our journey westward, but this proposal we thought it best to decline.

Thursday, 31. It snowed last night, and the morning is cold and disagreeable, with a high wind from the north-west: we sent five hunters down the river. Another man is taken with the pleurisy.

Friday, February 1. A cold windy day: our hunters returned, having killed only one deer. One of the Minnetaree war chiefs, a young man named Maubuksheahokeah or Seeing Snake, came to see us, and procure a war hatchet: he also requested that we would suffer him to go to war against the Sioux and Ricaras who had killed a Mandan some time ago: this we refused for reasons which we explained to him. He acknowledged that we were right, and promised to open his ears to our counsels.

Saturday, 2. The day is fine: another deer was killed. Mr. Laroche, who has been very anxious to go with us, left the fort to-day, and one of the squaws of the Minnetaree interpreter is taken ill.

Sunday, 3. The weather is again pleasant: disappointed in all our efforts to get the boats free, we occupied ourselves in making iron spikes, so as to prize them up by means of long poles.

Monday, 4. The morning fair and cold, the mercury at sunrise being 18° below 0, and the wind from the north-west. The stock of meat which we had procured in November and December being now nearly exhausted, it became necessary to renew our supply; Captain Clarke therefore took eighteen men, and with two sleighs and three horse

descended the river for the purpose of hunting, as the buffalo has disappeared from our neighbourhood, and the Indians are themselves suffering for want of meat. Two deer were killed to-day, but they were very lean.

Tuesday, 5. A pleasant fair morning with the wind from north-west: a number of the Indians come with corn for the blacksmith, who being now provided with coal, has become one of our greatest resources for procuring grain. They seem particularly attached to a battle-axe, of a very inconvenient figure: it is made wholly of iron, the blade extremely thin, and from seven to nine inches long; it is sharp at the point and five or six inches on each side, whence they converge towards the eye, which is circular and about an inch in diameter, the blade itself being not more than an inch wide, the handle is straight, and twelve or fifteen inches long; the whole weighing about a pound. By way of ornament, the blade is perforated with several circular holes. The length of the blade compared with the shortness of the handle, renders it a weapon of very little strength, particularly as it is always used on horseback: there is still, however, another form which is even worse, the same sort of handle being fixed to a blade resembling an espontoon.

Wednesday, February 6th. The morning was fair and pleasant, the wind N.W. A number of Indian chiefs visited us, and withdrew after we had smoked with them, contrary to their custom, for

after being once introduced into our apartment, they are fond of lounging about during the remainder of the day. One of the men killed three antelopes. Our blacksmith has his time completely occupied, so great is the demand for utensils of different kinds. The Indians are particularly fond of sheet iron, out of which they form points for arrows and instruments for scraping hides, and when the blacksmith cut up an old cambouse of that metal, we obtained for every piece of four inches square, seven or eight gallons of corn from the Indians, who were delighted at the exchange.

Thursday, 7. The morning was fair and much warmer than for some days, the thermometer being at 18° above 0, and the wind from the S.E. A number of Indians continue to visit us; but learning that the interpreter's squaws had been accustomed to unbar the gate during the night, we ordered a lock to be put on it, and that no Indian should remain in the fort all night, nor any person admitted during the hours when the gate is closed, that is from sunset to sunrise.

Friday, 8. A fair pleasant morning, with S.E. winds. Pocopsahe came down to the fort with a bow, and apologized for his not having finished a shield which he had promised Captain Lewis, and which the weather had prevented him from completing. This chief possesses more firmness, intelligence, and integrity, than any Indian of this country, and he might be rendered highly serviceable in our attempts to civilize the nation. He

mentioned that the Mandans are very much in want of meat, and that he himself had not tasted any for several days. To this distress they are often reduced by their own improvidence, or by their unhappy situation. Their principal article of food is buffaloe meat, their corn, beans, and other grain being reserved for summer, or as a last resource against what they constantly dread, an attack from the Sioux, who drive off the game and confine them to their villages. The same fear too prevents their going out to hunt in small parties to relieve their occasional wants, so that the buffaloe is generally obtained in large quantities: and wasted by carelessness.

Saturday 9. The morning was fair and pleasant, the wind from the S. E. Mr. M^cKenzie from the N. W. Company establishment visited us.

Sunday, 10. A slight snow fell in the course of the night, the morning was cloudy, and the north-west wind blew so high that although the thermometer was 18° above 0, the day was cooler than yesterday, when it was only 10° above the same point. Mr. M^cKenzie left us, and Chaboneau returned with information that our horses loaded with meat were below, but could not cross the ice, not being shod.

Monday, 11. We sent down a party with sleds, to relieve the horses from their loads; the weather fair and cold, with a N. W. wind. About five o'clock one of the wives of Chaboneau was delivered of a boy; this being her first child she was suffering

considerably, when Mr. Jessaume told Captain Lewis that he had frequently administered to persons in her situation, a small dose of the rattle of the rattle-snake, which had never failed to hasten the delivery. Having some of the rattle, Captain Lewis gave it to Mr. Jessaume, who crumbled two of the rings of it between his fingers, and mixing it with a small quantity of water gave it to her. What effect it may really have had it might be difficult to determine, but Captain Lewis was informed that she had not taken it more than ten minutes before the delivery took place.

Tuesday, 12. The morning is fair though cold, the mercury being 14° below 0, the wind from the S. E. About four o'clock the horses were brought in much fatigued; on giving them meal bran moistened with water they would not eat it, but preferred the bark of the cottonwood, which, as is already observed, forms their principal food during the winter. The horses of the Mandans are so often stolen by the Sioux, Ricaras, and Assiniboin, that the invariable rule now is to put the horses every night in the same lodge with the family. In the summer they ramble in the plains in the vicinity of the camp, and feed on the grass, but during cold weather the squaws cut down the cottonwood trees as they are wanted, and the horses feed on the boughs and bark of the tender branches, which are also brought into the lodges at night and placed near them. These animals are very severely treated; for whole days they are pursuing the buffaloe, or

burdened with the fruits of the chase, during which they scarcely ever taste food, and at night return to a scanty allowance of wood: yet the spirit of this valuable animal sustains him through all these difficulties, and he is rarely deficient either in flesh or vigour.

Wednesday, 13. The morning was cloudy, the thermometer at 2° below 0, the wind from the south-east. Captain Clarke returned last evening with all his hunting-party: during their excursion they had killed forty deer, three buffaloe, and sixteen elk; but most of the game was too lean for use, and the wolves, who regard whatever lies out at night as their own, had appropriated a large part of it: when he left the fort on the 4th instant, he descended on the ice twenty-two miles to New Mandan island, near some of their old villages, and encamped, having killed nothing, and therefore without food for the night.

Early on the 5th, the hunters went out and killed two buffaloe and a deer, but the last only could be used, the others being too lean. After breakfast they proceeded down to an Indian lodge and hunted during the day: the next morning, 6th, they encamped forty-four miles from the fort, on a sand point, near the mouth of a creek on the south-west side, which they call hunting creek, and during this and the following day, hunted through all the adjoining plains with much success, having killed a number of deer and elk. On the 8th, the best of the meat was sent with the horses to the

fort, and such parts of the remainder as were fit for use, were brought to a point of the river three miles below, and after the bones were taken out, secured in pens built of logs, so as to keep off the wolves, ravens, and magpies, who are very numerous, and constantly disappoint the hunter of his prey; they then went to the low grounds near the Chisshetaw river, where they encamped, but saw nothing except some wolves on the hills, and a number of buffaloe too poor to be worth hunting. The next morning, 9th, as there was no game, and it would have been inconvenient to send it back sixty miles to the fort, they returned up the river, and for three days hunted along the banks and plains, and reached the fort in the evening of the twelfth, much fatigued, having walked thirty miles that day on the ice, and through the snow, in many places knee deep, the moccasins too being nearly worn out: the only game which they saw, besides what is mentioned, was some growse on the sand-bars in the river.

Thursday, 14. Last night the snow fell three inches deep; the day was, however, fine. Four men were dispatched with sleds and three horses to bring up the meat which had been collected by the hunters. They returned however, with intelligence that about twenty-one miles below the fort a party of upwards of one hundred men, whom they supposed to be Sioux, rushed on them, cut the traces of the sleds, and carried off two of the horses, the third being given up by intercession

of an Indian who seemed to possess some authority over them; they also took away two of the men's knives, and a tomahawk, which last however they returned. We sent up to the Mandans to inform them of it, and to know whether any of them would join a party which intended to pursue the robbers in the morning. About twelve o'clock two of their chiefs came down and said that all their young men were out hunting, and that there were few guns in the village. Several Indians however, armed some with bows and arrows, some with spears and battle-axes, and two with fusils, accompanied Captain Lewis, who set out,

Friday, 15, at sunrise with twenty-four men. The morning was fine and cool, the thermometer being at 16° below 0. In the course of the day one of the Mandan chiefs returned from Captain Lewis's party, his eye-sight having become so bad that he could not proceed. At this season of the year the reflection from the ice and snow is so intense as to occasion almost total blindness. This complaint is very common, and the general remedy is to sweat the part affected, by holding the face over a hot stone, and receiving the fumes from snow thrown on it. A large red fox was killed to-day.

Saturday, 16. The morning was warm, mercury at 32° above 0, the weather cloudy: several of the Indians who went with Captain Lewis returned, as did also one of our men, whose feet had been frostbitten.

Sunday, 17. The weather continued as yesterday, though in the afternoon it became fair. Shottawhorora and his son came to see us, with about thirty pounds of dried buffaloe meat and some tallow.

Monday, 18. The morning was cloudy with some snow, but in the latter part of the day it cleared up. Mr. M'Kenzie, who had spent yesterday at the fort, now left us. Our stock of meat is exhausted, so that we must confine ourselves to vegetable diet, at least till the return of the party: for this, however, we are at no loss, since both on this and the following day,

Tuesday, 19, our blacksmith got large quantities of corn from the Indians, who came in great numbers to see us. The weather was fair and warm, the wind from the south.

Wednesday, 20. The day was delightfully fine; the mercury being at sunrise 2° , and in the course of the day 22° above 0, the wind southerly. Kagohami came down to see us early: his village is afflicted by the death of one of their eldest men, who, from his account to us, must have seen one hundred and twenty winters. Just as he was dying, he requested his grandchildren to dress him in his best robe when he was dead, and then carry him to a hill and seat him on a stone, with his face down the river towards their old villages, that he might go straight to his brother who had passed before him to the ancient village under ground. We have seen a number of Mandans who have lived

to a great age; chiefly however the men, whose robust exercises fortify the body, while the laborious occupations of the women shorten their existence.

Thursday, 21. We had a continuation of the same pleasant weather. Oheenaw and Shahaka came down to see us, and mentioned that several of their countrymen had gone to consult their medicine stone as to the prospects of the following year. The medicine stone is the great oracle of the Mandans, and whatever it announces is believed with implicit confidence. Every spring, and on some occasions during the summer, a deputation visits the sacred spot, where there is a thick porous stone twenty feet in circumference, with a smooth surface. Having reached the place, the ceremony of smoking to it is performed by the deputies, who alternately take a whiff themselves, and then present the pipe to the stone; after this they retire to an adjoining wood for the night, during which, it may be safely presumed that all the embassy do not sleep; and in the morning they read the destinies of the nation in the white marks on the stone, which those who made them are at no loss to decypher. The Minnetarees have a stone of a similar kind, which has the same qualities, and the same influence over the nation. Captain Lewis returned from his excursion in pursuit of the Indians. On reaching the place where the Sioux had stolen our horses, they found only one sled, and several pair of moccasins which

were recognised to be those of the Sioux. The party then followed the Indian tracks till they reached two old lodges, where they slept, and the next morning pursued the course of the river, till they reached some Indian camps, where Captain Clarke passed the night some time ago, and which the Sioux had now set on fire, leaving a little corn near the place, in order to induce a belief that they were Ricaras. From this point the Sioux tracks left the river abruptly and crossed into the plains; but perceiving that there was no chance of overtaking them, Captain Lewis went down to the pen where Captain Clarke had left some meat, which he found untouched by the Indians, and then hunted in the low grounds on the river, till he returned with about three thousand pounds of meat, some drawn in a sled by fifteen of the men, and the rest on horseback; having killed thirty-six deer, fourteen elk, and one wolf.

Friday, 22. The morning was cloudy and a little snow fell, but in the afternoon the weather became fair. We were visited by a number of Indians, among whom was Shotawhorora, a chief of much consideration among the Mandans, although by birth a Ricara.

Saturday, 23. The day is warm and pleasant. Having worked industriously yesterday and all this morning, we were enabled to disengage one of the perioques and haul it on shore, and also nearly to cut out the second. The father of the boy whose foot had been so badly frozen, and whom we

had now cured, came to-day and carried him home in a sleigh.

Sunday, 24. The weather is again fine. We succeeded in loosening the second perioque and barge, though we found a leak in the latter. The whole of the next day,

Monday, 25, we were occupied in drawing up the boats on the bank: the smallest one we carried there with no difficulty, but the barge was too heavy for our elk-skin ropes, which constantly broke. We were visited by Orupsehara, or black Moccasin, and several other chiefs, who brought us presents of meat on the backs of their squaws, and one of the Minnetarees requested and obtained permission for himself and his two wives to remain all night in the fort. The day was exceedingly pleasant.

Tuesday, 26. The weather is again fine. By great labour during the day, we got all the boats on the bank by sun-set, an operation which attracted a great number of Indians to the fort.

Wednesday, 27. The weather continues fine. All of us employed in preparing tools to build boats for our voyage, as we find that small periouques will be much more convenient than the barge in ascending the Missouri.

Thursday, 28. The day is clear and pleasant. Sixteen men were sent out to examine the country for trees suitable for boats, and were successful in finding them. Two of the N. W. Company traders arrived with letters; they had likewise a root which is used for the cure of persons

bitten by mad dogs, snakes, and other venomous animals; it is found on high grounds and the sides of hills, and the mode of using it, is to scarify the wound, and apply to it an inch or more of the chewed or pounded root, which is to be renewed twice a-day; the patient must not, however, chew or swallow any of the root, as an inward application might be rather injurious than beneficial.

Mr. Gravelines with two Frenchmen and two Indians, arrived from the Ricara nation, with letters from Mr. Anthony Tabeau. This last gentleman informs us, that the Ricaras express their determination to follow our advice, and to remain at peace with the Mandans and Minnetarees, whom they are desirous of visiting; they also wish to know whether these nations would permit the Ricaras to settle near them, and form a league against their common enemies the Sioux. On mentioning this to the Mandans, they agree to it, observing that they always desired to cultivate friendship with the Ricaras, and that the Ahnahaways and Minnetarees have the same friendly views.

Mr. Gravelines states that the band of Tetons whom we had seen was well disposed to us, owing to the influence of their chief, the Black Buffaloe; but that the three upper bands of Tetons, with the Sisatoons, and the Yanktons of the north, mean soon to attack the Indians in this quarter, with a resolution to put to death every white man they encounter. Moreover, that Mr. Cameron of St.

Peter's has armed the Sioux against the Chippewas, who have lately put to death three of his men. The men who had stolen our horses we found to be all Sioux, who after committing the outrage, went to the Ricara villages, where they said, that they had hesitated about killing our men who were with the horses, but that in future they would put to death any of us they could, as we were bad medicines and deserved to be killed. The Ricaras were displeased at their conduct, and refused to give them any thing to eat, which is deemed the greatest act of hostility short of actual violence.

Friday, March 1. The day is fine, and the whole party is engaged, some making ropes and perioques, others in burning coal, and making battle-axes to sell for corn.

Saturday, 2. Mr. Laroche one of the N. W. Company's traders has just arrived with merchandize from the British establishments on the Assiniboin. The day is fine, and the river begins to break up in some places, the mercury being between 28° and 36° below 0, and the wind from the N. E. We were visited by several Indians.

Sunday, 3. The weather pleasant, the wind from the E. with clouds; in the afternoon the clouds disappeared and the wind came from the N. W. The men are all employed in preparing the boats; we are visited by Poscapsahe and several other Indians with corn. A flock of ducks passed up the river to-day.

Monday, 4. A cloudy morning with N. W. wind, the latter part of the day clear. We had again some Indian visitors with a small present of meat. The Assiniboins, who a few days since visited the Mandans, returned and attempted to take horses from the Minnetarees, who fired on them; a circumstance which may occasion some disturbance between the two nations.

Tuesday 5. About four o'clock in the morning there was a slight fall of snow, but the day became clear and pleasant, with the mercury 40° above 0. We sent down an Indian and a Frenchman to the Ricara villages with a letter to Mr. Tabeau.

Wednesday, 6. The day was cloudy and smoky in consequence of the burning of the plains by the Minnetarees; they have set all the neighbouring country on fire in order to obtain an early crop of grass, which may answer for the consumption of their horses, and also as an inducement for the buffaloe and other game to visit it. The horses stolen two days ago by the Assiniboins have been returned to the Minnetarees. Ohhaw, second chief of the lower Minnetaree village came to see us. The river rose a little and overran the ice, so as to render the crossing difficult.

Thursday, 7. The day was somewhat cloudy, and colder than usual; the wind from the north-east. Shotawhorora visited us with a sick child, to whom some medicine was administered. There were also other Indians who brought corn and dried buffaloe meat in exchange for blacksmiths' work.

Friday, 8. The day cold and fair, with a high easterly wind: we were visited by two Indians, who gave us an account of the country and people near the Rocky mountains, where they had been.

Saturday, 9. The morning cloudy and cool, the wind from the north. The grand chief of the Minnetarees, who is called by the French Le Borgne, from his having but one eye, came down for the first time to the fort. He was received with much attention, two guns were fired in honour of his arrival, the curiosities were exhibited to him, and, as he said that he had not received the presents which we had sent to him on his arrival, we again gave him a flag, a medal, shirt, armbraces, and the usual presents on such occasions, with all which he was much pleased. In the course of the conversation, the chief observed, that some foolish young men of his nation had told him there was a person among us quite black, and he wished to know if it could be true. We assured him that it was true, and sent for York: the Borgne was very much surprised at his appearance, examined him closely, and spit on his finger and rubbed the skin in order to wash off the paint; nor was it until the negro uncovered his head, and showed his short hair, that the Borgne could be persuaded that he was not a painted white man.

Sunday, 10. A cold windy day. Tetuckopinreha, chief of the Ahnahaways, and the Minnetaree chief Ompschara, passed the day with us, and the former remained during the night. We had occa-

sion to see an instance of the summary justice of the Indians: a young Minnetaree had carried off the daughter of Cagonomokshe, the Raven Man, second chief of the upper village of the Mandans; the father went to the village and found his daughter, whom he brought home, and took with him a horse belonging to the offender: this reprisal satisfied the vengeance of the father and of the nation, as the young man would not dare to reclaim his horse, which from that time became the property of the injured party. The stealing of young women is one of the most common offences against the police of the village, and the punishment of it always measured by the power or the passions of the kindred of the female. A voluntary elopement is of course more rigorously chastised. One of the wives of the Borgne deserted him in favour of a man who had been her lover before the marriage, and who after some time left her, and she was obliged to return to her father's house. As soon as he heard it the Borgne walked there and found her sitting near the fire: without noticing his wife, he began to smoke with the father; when they were joined by the old men of the village, who, knowing his temper, had followed in hopes of appeasing him. He continued to smoke quietly with them, till rising to return, he took his wife by the hair, led her as far as the door, and with a single stroke of his tomahawk put her to death before her father's eyes: then turning fiercely upon the spectators, he said that if any of her relations wished to

avenge her, they might always find him at his lodge; but the fate of the woman had not sufficient interest to excite the vengeance of the family. The caprice or the generosity of the same chief gave a very different result to a similar incident which occurred some time afterwards. Another of his wives eloped with a young man, who not being able to support her as she wished, they both returned to the village, and she presented herself before the husband, supplicating his pardon for her conduct: the Borgne sent for the lover: at the moment when the youth expected that he would be put to death, the chief mildly asked them if they still preserved their affection for each other; and on their declaring that want, and not a change of affection had induced them to return, he gave up his wife to her lover, with the liberal present of three horses, and restored them both to his favour.

Monday, 11. The weather was cloudy in the morning and a little snow fell, the wind then shifted from south-east to north-west, and the day became fair. It snowed again in the evening; but the next day,

Tuesday, 12, was fair with the wind from the north-west.

Wednesday, 13. We had a fine day, and a south-west wind. Mr. M'Kenzie came to see us, as did also many Indians who are so anxious for battle-axes that our smiths have not a moment's leisure, and procure us an abundance of corn. The river rose a little to-day, and so continued.

Thursday, 14. The wind being from the west, and the day fine, the whole party was employed in building boats and in shelling corn.

Friday, 15. The day is clear, pleasant, and warm. We take advantage of the fine weather to hang all our Indian presents, and other articles, out to dry before our departure.

Saturday, 16. The weather is cloudy, the wind from the south-east. A Mr. Garrow, a Frenchman who has resided a long time among the Ricaras and Mandans, explained to us the mode in which they make their large beads, an art which they are said to have derived from some prisoners of the Snake Indian nation, and the knowledge of which is a secret, even now confined to a few among the Mandans and Ricaras: the process is as follows: glass of different colours is first pounded fine and washed, till each kind, which is kept separate, ceases to stain the water thrown over it: some well-seasoned clay, mixed with a sufficient quantity of sand, to prevent its becoming very hard when exposed to heat, and reduced by water to the consistency of dough, is then rolled on the palm of the hand, till it becomes of the thickness wanted for the hole in the bead: these sticks of clay are placed upright, each on a little pedestal or ball of the same material, about an ounce in weight, and distributed over a small earthen platter, which is laid on the fire for a few minutes, when they are taken off to cool: with a little paddle or shovel, three or four inches long and sharpened at the end of the handle, the

wet pounded glass is placed in the palm of the hand: the beads are made of an oblong form, wrapped in a cylindrical form round the stick of clay, which is laid crosswise over it, and gently rolled backwards and forwards till it becomes perfectly smooth. If it be desired to introduce any other colour, the surface of the bead is perforated with the pointed end of the paddle, and the cavity filled with pounded glass of that colour: the sticks with the string of beads are then replaced on their pedestals, and the platter deposited on burning coals or hot embers: over the platter an earthen pot, containing about three gallons, with a mouth large enough to cover the platter, is reversed, being completely closed, except a small aperture at the top, through which are watched the beads: a quantity of old dried wood, formed into a sort of dough or paste, is placed round the pot, so as almost to cover it, and afterwards set on fire: the manufacturer then looks through the small hole in the pot, till he sees the beads assume a deep red colour, to which succeeds a paler or whitish red, or they become pointed at the upper extremity; on which the fire is removed and the pot suffered to cool gradually: at length it is removed, the beads taken out, the clay in the hollow of them picked out with an awl or needle, and it is then fit for use. The beads thus formed are in great demand among the Indians, and used as pendants to their ears and hair, and are sometimes worn round the neck.

Sunday, 17. A windy but clear and pleasant day, the river rising a little, and open in several places. Our Minnetaree interpreter Chaboneau, whom we intended taking with us to the Pacific, had some days ago been worked upon by the British traders, and appeared unwilling to accompany us, except on certain terms; such as his not being subject to our orders, and do duty, or to return whenever he chose. As we saw clearly the source of his hesitation, and knew that it was intended as an obstacle to our views, we told him that the terms were inadmissible, and that we could dispense with his services: he had accordingly left us with some displeasure. Since then he had made an advance towards joining us, which we showed no anxiety to meet; but this morning he sent an apology for his improper conduct, and agreed to go with us and perform the same duties as the rest of the corps; we therefore took him again into our service.

Monday, 18. The weather was cold and cloudy, the wind from the north. We were engaged in packing up the goods into eight divisions, so as to preserve a portion of each in case of accident. We hear that the Sioux have lately attacked a party of Assiniboin and Knistenaux, near the Assiniboin river, and killed fifty of them.

Tuesday, 19. Some snow fell last night, and this morning was cold, windy, and cloudy. Shahaka and Kagohami came down to see us, as did another Indian with a sick child, to whom we gave some medicine. There appears to be an approaching

war, as two parties have already gone from the Minnetarees, and a third is preparing.

Wednesday, 20. The morning was cold and cloudy, the wind high from the north, but the afternoon was pleasant. The canoes being finished, four of them were carried down to the river, at the distance of a mile and a half from where they were constructed.

Thursday, 21. The remaining perioques were hauled to the same place, and all the men except three, who were left to watch them, returned to the fort. On his way down, which was about six miles, Captain Clarke passed along the points of the high hills, where he saw large quantities of pumicestone on the foot, sides, and tops of the hills, which had every appearance of having been at some period on fire. He collected specimens of the stone itself, the pumicestone, and the hard earth; and on being put into the furnace the hard earth melted and glazed, the pumicestone melted, and the hard stone became a pumicestone glazed.

CHAPTER VII.

INDIAN METHOD OF ATTACKING THE BUFFALOE ON THE ICE — AN ENUMERATION OF THE PRESENTS SENT TO THE PRESIDENT OF THE UNITED STATES — THE PARTY ARE VISITED BY A RICARA CHIEF — THEY LEAVE THEIR ENCAMPMENT, AND PROCEED ON THEIR JOURNEY — DESCRIPTION OF THE LITTLE MISSOURI — SOME ACCOUNT OF THE ASSINIBOINS — THEIR MODE OF BURYING THE DEAD — WHITEEARTH RIVER DESCRIBED — GREAT QUANTITY OF SALT DISCOVERED ON ITS BANKS — YELLOWSTONE RIVER DESCRIBED — A PARTICULAR ACCOUNT OF THE COUNTRY AT THE CONFLUENCE OF THE YELLOWSTONE AND MISSOURI — DESCRIPTION OF THE MISSOURI, THE SURROUNDING COUNTRY, AND OF THE RIVERS, CREEKS, ISLANDS, &c.

FRIDAY, 22. This was a clear pleasant day, with the wind from the S. S. W. We were visited by the second chief of the Minnetarees, to whom we gave a medal and some presents, accompanied by a speech. Mr. M'Kenzie and Mr. Laroche also came to see us. They all took their leave next day.

Saturday, 23. Soon after their departure, a brother of the Borgne with other Indians came to the fort. The weather was fine, but in the evening we had the first rain that has fallen during the winter.

Sunday, 24. The morning cloudy, but the afternoon fair, the wind from the N. E. We are employed in preparing for our journey. This evening swans and wild-geese flew towards the N. E.

Monday, 25. A fine day, the wind S. W. The river rose nine inches, and the ice began breaking away in several places, so as to endanger our canoes, which we are hauling down to the fort.

Tuesday, 26. The river rose only half an inch, and being choaked up with ice near the fort, did not begin to run till towards evening. This day is clear and pleasant.

Wednesday, 27. The wind is still high from the S. W.: the ice which is occasionally stopped for a few hours, is then thrown over shallow sandbars when the river runs. We had all our canoes brought down, and were obliged to caulk and pitch very attentively the cracks so common in cottonwood.

Thursday, 28. The day is fair. Some obstacle above has prevented the ice from running. Our canoes are now nearly ready, and we expect to set out as soon as the river is sufficiently clear to permit us to pass.

Friday, 29. The weather clear, and the wind from N. W. The obstruction above gave way this morning, and the ice came down in great quantities; the river having fallen eleven inches in the course of the last twenty-four hours. We have had few Indians at the fort for the last three or four days, as they are now busy in catching the floating

buffaloe. Every spring, as the river is breaking up, the surrounding plains are set on fire, and the buffaloe tempted to cross the river in search of the fresh grass which immediately succeeds to the burning: on their way they are often insulated on a large cake or mass of ice, which floats down the river. The Indians now select the most favourable points for attack; and, as the buffaloe approaches, dart with astonishing agility across the trembling ice, sometimes pressing lightly a cake of not more than two feet square: the animal is of course unsteady, and his footsteps insecure on this new element, so that he can make but little resistance, and the hunter, who has given him his death-wound, paddles his icy boat to the shore, and secures his prey.

Saturday, 30. The day was clear and pleasant, the wind N. W. and the ice running in great quantities. All our Indian presents were again exposed to the air, and the barge made ready to descend the Missouri.

Monday, 31. Early this morning it rained, and the weather continued cloudy during the day; the river rose nine inches, the ice not running so much as yesterday. Several flocks of geese and ducks fly up the river.

Monday, April 1, 1805. This morning there was a thunder-storm, accompanied with large hail, to which succeeded rain for about half an hour. We availed ourselves of this interval to get all the boats in the water. At four o'clock P. M. it

began to rain a second time, and continued till twelve at night. With the exception of a few drops at two or three different times, this is the first rain we have had since the 15th of October last.

Tuesday, 2. The wind was high last night, and this morning from N.W. and the weather continued cloudy. The Mandans killed yesterday twenty-one elk, about fifteen miles below, but they were so poor as to be scarcely fit for use.

Wednesday, 3. The weather is pleasant, though there was a white frost and some ice on the edge of the water. We were all engaged in packing up our baggage and merchandize.

Thursday, 4. The day is clear and pleasant, though the wind is high from N.W. We now packed in different boxes a variety of articles for the president, which we shall send in the barge. They consisted of a stuffed male and female antelope, with their skeletons, a weasel, three squirrels from the Rocky mountains, the skeleton of the prairie wolf, those of the white and grey hare, a male and female blaireau, or burrowing dog of the prairie, with a skeleton of the female, two burrowing squirrels, a white weasel, and the skin of the louservia, the horns of the mountain ram, or big-horn, a pair of large elk horns, the horns and tail of the black-tailed deer, and a variety of skins, such as those of the red fox, white hare, martin, yellow bear obtained from the Sioux: also, a number of articles of Indian dress, among which was a buffaloe robe,

representing a battle fought about eight years since between the Sioux and Ricaras against the Mandans and Minnetarees, in which the combatants are represented on horseback. It has of late years excited much discussion to ascertain the period when the art of painting was first discovered: how hopeless all researches of this kind are, is evident from the foregoing fact. It is indebted for its origin to one of the strongest passions of the human heart; a wish to preserve the features of a departed friend, or the memory of some glorious exploit: this inherits equally the bosoms of all men, either civilized or savage. Such sketches, rude and imperfect as they are, delineate the predominant character of the savage nations. If they are peaceable and inoffensive, the drawings usually consist of local scenery, and their favourite diversions. If the band are rude and ferocious, we observe tomahawks, scalping-knives, bows, arrows, and all the engines of destruction. A Mandan bow and quiver of arrows; also some Ricara tobacco-seed, and an ear of Mandan corn: to these were added, a box of plants, another of insects, and three cases, containing a burrowing squirrel, a prairie hen, and four magpies, all alive.

Friday, 5th. Fair and pleasant, but the wind high from the north-west: we were visited by a number of Mandans, and are occupied in loading our boats, in order to proceed on our journey.

Saturday, 6th. Another fine day with a gentle

breeze from the south. The Mandans continue to come to the fort; and in the course of the day informed us of the arrival of a party of Ricaras on the other side of the river. We sent our interpreter to inquire into their reason for coming; and in the morning,

Sunday, 7th, he returned with a Ricara chief and three of his nation. The chief, whose name is Kagohweto, or Brave Raven, brought a letter from Mr. Tabeau, mentioning the wish of the grand chiefs of the Ricaras to visit the president, and requesting permission for himself and four men to join our boat when it descends; to which we consented, as it will then be manned with fifteen hands, and be able to defend itself against the Sioux. After presenting the letter, he told us that he was sent with ten warriors, by his nation, to arrange their settling near the Mandans and Minnetarees, whom they wished to join; that he considered all the neighbouring nations friendly, except the Sioux, whose persecution they could no longer withstand, and whom they hoped to repel by uniting with the tribes in this quarter: he added, that the Ricaras intended to follow our advice and live in peace with all nations, and requested that we would speak in their favour to the Assiniboin Indians. This we willingly promised to do, and assured them that their great father would protect them, and no longer suffer the Sioux to have good guns, or to injure his dutiful children. We then gave him a small medal, a certificate of his good

conduct, a carrot of tobacco, and some wampum, with which he departed for the Mandan village, well satisfied with his reception. Having made all our arrangements, we left the fort about five o'clock in the afternoon. The party now consisted of thirty-two persons. Besides ourselves were Sergeants John Ordway, Nathaniel Pryor, and Patrick Gass: the privates were William Bratton, John Colter, John Collins, Peter Cruzatte, Robert Frazier, Reuben Fields, Joseph Fields, George Gibson, Silas Goodrich, Hugh Hall, Thomas P. Howard, Baptiste Lapage, Francis Labiche, Hugh M'Neal, John Potts, John Shields, George Shannon, John B. Thompson, William Werner, Alexander Willard, Richard Windsor, Joseph Whitehouse, Peter Wiser, and Captain Clarke's black Servant, York. The two interpreters, were George Drewyer and Tous-saint Chaboneau. The wife of Chaboneau also accompanied us with her young child, and we hope may be useful as an interpreter among the Snake Indians. She was herself one of that tribe, but having been taken in war by the Minnetarees, by whom she was sold as a slave to Chaboneau, who brought her up and afterwards married her. One of the Mandans likewise embarked with us, in order to go to the Snake Indians, and obtain a peace with them for his countrymen. All this party with the baggage was stowed in six small canoes and two large perioques. We left the fort with fair pleasant weather, though the north-west wind was high, and after making about four miles, en-

camped on the north side of the Missouri, nearly opposite the first Mandan village. At the same time that we took our departure, our barge, manned with seven soldiers, two Frenchmen, and Mr. Gravelines as pilot, sailed for the United States loaded with our presents and dispatches.

Monday, 8th. The day was clear and cool, the wind from the north-west, so that we travelled slowly. After breakfasting at the second Mandan village, we passed the Mahaha at the mouth of Knife river, a handsome stream, about eighty yards wide. Beyond this we reached the island which Captain Clarke had visited on the 30th October. This island has timber as well as the lowlands on the north, but its distance from the water had prevented our encamping there during the winter. From the head of this island we made three and a half miles to a point of wood on the north, passing a high bluff on the south, and having come about fourteen miles. In the course of the day one of our boats filled and was near sinking; we however saved her with the loss of a little biscuit and powder.

Tuesday, April 9. We set off as soon as it was light, and proceeded five miles to breakfast, passing a low ground on the south, covered with groves of cotton-wood timber. At the distance of six miles, we reached on the north a hunting camp of Minnetarees, consisting of thirty lodges, and built in the usual form of earth and timber. Two mile and a quarter farther, comes in on the same

side Miry creek, a small stream about ten yards wide, which, rising in some lakes near the Mouse river, passes through beautiful level fertile plains without timber, in a direction nearly south-west; the banks near its entrance being steep and rugged on both sides of the Missouri. Three miles above this creek, we came to a hunting party of Minnetarees, who had prepared a park or enclosure, and were waiting the return of the antelope: these animals, which in the autumn retire for food and shelter to the Black mountains during the winter, recross the river at this season of the year, and spread themselves through the plains on the north of the Missouri. We halted and smoked a short time with them, and then proceeded on through handsome plains on each side of the river, and encamped at the distance of twenty-three and a half miles on the north side: the day was clear and pleasant, the wind high from the south, but afterwards changed to a western steady breeze. The bluffs which we passed to-day are upwards of one hundred feet high, composed of a mixture of yellow clay and sand, with many horizontal strata of carbonated wood resembling pit-coal, from one to five feet in depth, and scattered through the bluff at different elevations, some as high as eighty feet above the water: the hills along the river are broken, and present every appearance of having been burned at some former period; great quantities of pumicestone and lava, or rather earth, which seems to have been boiled and then hardened

by exposure, being seen in many parts of these hills, where they are broken and washed down into gullies by the rain and melting snow. A great number of brants pass up the river: there are some of them perfectly white, except the large feathers of the first and second joint of the wing, which are black, though in every other characteristic they resemble common grey brant: we also saw, but could not procure, an animal that burrows in the ground, and similar in every respect to the burrowing squirrel, except that it is only one third of its size. This may be the animal whose works we have often seen in the plains and prairies; they resemble the labours of the salamander in the sand hills of South Carolina and Georgia, and like him, the animals rarely come above ground; they consist of a little hillock of ten or twelve pounds of loose ground which would seem to have been reversed from a pot, though no aperture is seen through which it could have been thrown: on removing gently the earth, you discover that the soil has been broken in a circle of about an inch and a half diameter, where the ground is looser, though still no opening is perceptible. When we stopped for dinner the squaw went out, and after penetrating with a sharp stick the holes of the mice, near some drift wood, brought to us a quantity of wild artichokes, which the mice collect and hoard in large numbers; the root is white, of an ovate form, from one to three inches long, and generally of the size of a man's finger, and two, four, and sometimes

six roots are attached to a single stalk. Its flavour, as well as the stalk which issues from it, resemble those of the Jerusalem artichoke, except that the latter is much larger. A large beaver was caught in a trap last night, and the mosquitoes begin to trouble us.

Wednesday, 10. We again set off early with clear pleasant weather, and halted about ten for breakfast, above a sand-bank which was falling in, and near a small willow island. On both sides of the Missouri, after ascending the hills near the water, one fertile unbroken plain extends itself as far as the eye can reach, without a solitary tree or shrub, except in moist situations, or in the steep declivities of hills, where they are sheltered from the ravages of fire. At the distance of twelve miles we reached the lower point of a bluff on the south; which is in some parts on fire, and throws out quantities of smoke which has a strong sulphureous smell, the coal and other appearances in the bluffs being like those described yesterday: at one o'clock we overtook three Frenchmen who left the fort a few days before us, in order to make the first attempt on this river of hunting beaver, which they do by means of traps: their efforts promise to be successful, for they have already caught twelve which are finer than any we have ever seen: they mean to accompany us as far as the Yellow-stone river, in order to obtain our protection against the Assiniboins, who might attack them. In the evening we encamped on a willow

point to the south, opposite to a bluff, above which a small creek falls in, and just above a remarkable bend in the river to the south-west, which we called the Little Basin. The low grounds which we passed to-day possess more timber than is usual, and are wider; the current is moderate, at least not greater than that of the Ohio in high tides; the banks too fall in but little: so that the navigation, comparatively with that lower down the Missouri, is safe and easy. We were enabled to make eighteen and a half miles: we saw the track of a large white bear; there were also a herd of antelopes in the plains; the geese and swan are now feeding in considerable quantities on the young grass in the low prairies; we shot a prairie hen, and a bald eagle, of which there were many nests in the tall cotton-wood trees; but could procure neither of two elk which were in the plain. Our old companions the mosquitoes have renewed their visit, and given us much uneasiness.

Thursday, 11. We set out at day-light, and after passing bare and barren hills on the south, and a plain covered with timber on the north, breakfasted at five miles distance: here we were regaled with a deer brought in by the hunters, which was very acceptable, as we had been for several days without fresh meat; the country between this and fort Mandan being so frequently disturbed by hunters, that the game has become scarce. We then proceeded with a gentle breeze from the south, which carried the perioques on very well; the day was,

however so warm, that several of the men worked with no clothes except round the waist, which is the less inconvenient, as we were obliged to wade in some places, owing to the shallowness of the river. At seven miles we reached a large sandbar making out from the north. We again stopped for dinner, after which we went on to a small plain on the north, covered with cotton-wood, where we encamped, having made nineteen miles. The country around is much the same as that we passed yesterday: on the sides of the hills, and even on the banks of the rivers, as well as on the sandbars, is a white substance which appears in considerable quantities on the surface of the earth, and tastes like a mixture of common salt with Glauber salts: many of the streams which come from the foot of the hills, are so strongly impregnated with this substance, that the water has an unpleasant taste and a purgative effect. A beaver was caught last night by one of the Frenchmen; we killed two geese, and saw some cranes, the largest bird of that kind common to the Missouri and Mississippi, and perfectly white, except the large feathers on the two first joints of the wing, which are black. Under a bluff opposite to our encampment, we discovered some Indians with horses, whom we supposed were Minnetarees, but the width of the river prevented our speaking to them.

Friday, 12. We set off early and passed a high range of hills on the south side, our perioques being obliged to go over to the south, in order to

avoid a sandbank which was rapidly falling in. At six miles we came to at the lower side of the entrance of the Little Missouri, where we remained during the day for the purpose of making celestial observations. This river empties itself on the south side of the Missouri, one thousand six hundred and ninety-three miles from its confluence with the Mississippi. It rises to the west of the Black mountains, across the northern extremity of which it finds a narrow rapid passage along high perpendicular banks, then seeks the Missouri in a north-eastern direction, through a broken country with highlands bare of timber, and the low grounds particularly supplied with cotton-wood, elm, small ash, box, alder, and an undergrowth of willow, red-wood, sometimes called red or swamp-willow, the redberry and chokecherry. In its course it passes near the north-west side of the Turtle-mountain, which is said to be only twelve or fifteen miles from its mouth in a straight line a little to the south of west, so that both the Little Missouri and Knife river have been laid down too far south-west. It enters the Missouri with a bold current, and is one hundred and thirty-four yards wide, but its greatest depth is two feet and a half, and this joined to its rapidity and its sandbars, makes the navigation difficult except for canoes, which may ascend it for a considerable distance. At the mouth, and as far as we could discern from the hills between the two rivers, about three miles from their junction, the country is much broken,

the soil consisting of a deep rich dark-coloured loam, intermixed with a small proportion of fine sand, and covered generally with a short grass resembling blue grass. In its colour, the nature of its bed, and its general appearance, it resembles so much the Missouri, as to induce a belief that the countries they water are similar in point of soil. From the Mandan villages to this place, the country is hilly and irregular, with the same appearance of Glauber salts and carbonated wood, the low grounds smooth, sandy, and partially covered with cotton-wood and small ash; at some distance back, there are extensive plains of a good soil, but without timber or water.

We found great quantities of small onions, which grow single, the bulb of an oval form, white, about the size of a bullet, with a leaf resembling that of the shieve. On the side of a neighbouring hill, there is a species of dwarf cedar: it spreads its limbs along the surface of the earth, which it almost conceals by its closeness and thickness, and is sometimes covered by it, having always a number of roots on the under side, while on the upper are a quantity of shoots, which, with their leaves, seldom rise higher than six or eight inches; it is an evergreen, its leaf more delicate than that of the common cedar, though the taste and smell are the same.

The country around has been so recently hunted that the game are extremely shy, so that a white rabbit, two beaver, a deer, and a bald eagle, were

all that we could procure. The weather had been clear, warm, and pleasant in the morning, but about three we had a squall of high wind and rain, with some thunder, which lasted till after sunset, when it again cleared off.

Saturday, 13. We set out at sunrise, and at nine o'clock, having the wind in our favour, went on rapidly past a timbered low ground on the south, and a creek on the north at the distance of nine miles, which we called Onion creek, from the quantity of that plant which grows in the plains near it: this creek is about sixteen yards wide at a mile and a half above its mouth; it discharges more water than is usual for creeks of that size in this country, but the whole plain which it waters is totally destitute of timber. The Missouri itself widens very remarkably just above the junction with the Little Missouri: immediately at the entrance of the latter, it is not more than two hundred yards wide, and so shallow that it may be passed in canoes with setting poles, while a few miles above it is upwards of a mile in width: ten miles beyond Onion creek we came to another, discharging itself on the north, in the centre of a deep bend: on ascending it for about a mile and a half, we found it to be the discharge of a pond or small lake, which seemed to have been once the bed of the Missouri: near this lake were the remains of forty-three temporary lodges, which seem to belong to the Assiniboin, who are now on the river of the same name. A great number of swan

and geese were also in it, and from this circumstance we named the creek Goose creek, and the lake by the same name: these geese we observe do not build their nests on the ground or in sand-bars, but in the tops of lofty cotton-wood trees. We saw some elk and buffaloe to-day, but at too great a distance to obtain any of them, though a number of the carcasses of the latter animal are strewed along the shore, having fallen through the ice, and been swept along when the river broke up. More bald eagles are seen on this part of the Missouri than we have previously met with; the small or common hawk, common in most parts of the United States, are also found here: great quantities of geese are feeding in the prairies, and one flock of white brant or geese with black wings, and some grey brant with them, pass up the river, and from their flight they seem to proceed much farther to the north-west. We killed two antelopes which were very lean, and caught last night two beaver: the French hunters, who had procured seven, thinking the neighbourhood of the Little Missouri a convenient hunting ground for that animal, remained behind there: in the evening we encamped in a beautiful plain on the north, thirty feet above the river, having made twenty-two and a half miles.

Sunday, 14. We set off early with pleasant and fair weather: a dog joined us, which we suppose had strayed from the Assiniboin camp on the lake. At two and a half miles we passed timbered low

grounds and a small creek: in these low grounds are several uninhabited lodges built with the boughs of the elm, and the remains of two recent encampments, which, from the hoops of small kegs found in them, we judged could belong to Assiniboins only, as they are the only Missouri Indians who use spirituous liquors: of these they are so passionately fond that it forms their chief inducement to visit the British on the Assiniboin, to whom they barter for kegs of rum their dried and pounded meat, their grease, and the skins of large and small wolves, and small foxes. The dangerous exchange is transported to their camps with their friends and relations, and soon exhausted in brutal intoxication: so far from considering drunkenness as disgraceful, the women and children are permitted and invited to share in these excesses with their husbands and fathers, who boast how often their skill and industry as hunters has supplied them with the means of intoxication: in this, as in their other habits and customs, they resemble the Sioux from whom they are descended: the trade with the Assiniboins and Knistenaux is encouraged by the British, because it procures provision for their *engages* on their return from Rainy lake to the English river and the Athabasky country where they winter; these men being obliged during that voyage to pass rapidly through a country but scantily supplied with game. We halted for dinner near a large village of burrowing squirrels, who we observe generally select a south-easterly ex-

posure, though they are sometimes found in the plains. At ten and a quarter miles we came to the lower point of an island, which, from the day of our arrival there we called Sunday island: here the river washes the bases of the hills on both sides and above the island, which with its sandbar extends a mile and a half: two small creeks fall in from the south; the uppermost of these, which is the largest, we called Chaboneau's creek, after our interpreter, who once encamped on it several weeks with a party of Indians. Beyond this no white man had ever been except two Frenchmen, one of whom, Lapage, is with us, and who, having lost their way, straggled a few miles further, though to what point we could not ascertain: about a mile and a half beyond this island we encamped on a point of woodland on the north, having made in all fourteen miles.

The Assiniboins have so recently left the river that game is scarce and shy. One of the hunters shot at an otter last evening; a buffaloe too was killed, and an elk, both so poor as to be almost unfit for use; two white bears were also seen, and a musk-rat swimming across the river. The river continues wide and of about the same rapidity as the ordinary current of the Ohio. The low grounds are wide, the moister parts containing timber, the upland extremely broken, without wood, and in some places seem as if they had slipped down in masses of several acres in surface. The mineral appearances of salts, coal, and sulphur, with the

burnt hill and pumicestone continue, and a bituminous water, about the colour of strong lye, with the taste of Glauber salts and a slight tincture of alum. Many geese were feeding in the prairies, and a number of magpies, who build their nests much like those of the black-bird, in trees, and composed of small sticks, leaves and grass, open at top: the egg is of a bluish brown colour, freckled with reddish brown spots. We also killed a large hooting owl resembling that of the United States, except that it was more booted and clad with feathers. On the hills are many aromatic herbs, resembling in taste, smell, and appearance, the sage, hyssop, wormwood, southern wood, juniper and dwarf cedar; a plant also about two or three feet high, similar to the camphor in smell and taste, and another plant of the same size, with a long, narrow, smooth, soft leaf, of an agreeable smell and flavour, which is a favourite food of the antelope, whose necks are often perfumed by rubbing against it.

Monday, 15. We proceeded under a fine breeze from the south, and clear pleasant weather. At seven miles we reached the lower point of an island in a bend to the south, which is two miles in length. Captain Clarke, who went about nine miles northward from the river, reached the high grounds, which, like those we have seen, are level plains without timber; here he observed a number of drains, which descending from the hills pursue a north-east course, and probably empty into the Mouse river, a branch of the Assiniboin, which from Indian ac-

counts approaches very near to the Missouri at this place. Like all the rivulets of this neighbourhood these drains were so strongly impregnated with mineral salts that they are not fit to drink. He saw also the remains of several camps of Assiniboins: the low grounds on both sides of the river are extensive, rich, and level. In a little pond on the north, we heard for the first time this season the croaking of frogs, which exactly resembles that of the small frogs in the United States: there are also in these plains great quantities of geese, and many of the grouse, or prairie hen, as they are called by the N. W. Company Traders; the note of the male, as far as words can represent it, is cook, cook, cook, coo, coo, coo, the first part of which both male and female use when flying; the male too drums with his wings when he flies in the same way, though not so loud, as the pheasant; they appear to be mating. Some deer, elk, and goats were in the low grounds, and buffaloe on the sand beaches, but they were uncommonly shy; we also saw a black bear, and two white ones. At fifteen miles we passed on the north side a small creek twenty yards wide, which we called Goatpen creek, from a park or enclosure for the purpose of catching that animal, which those who went up the creek found, and which we presume to have been left by the Assiniboins. Its water is impregnated with mineral salts, and the country through which it flows consists of wide and very fertile plains, but without any trees. We encamped at the distance of twenty-three miles.

on a sandpoint to the south; we passed in the evening a rock in the middle of the river, the channel of which a little above our camp, is confined within eighty yards.

Tuesday, 16. The morning was clear, the wind light from the S.E. The country presents the same appearance of low plains and meadows on the river, bounded a few miles back by broken hills, which end in high level fertile lands: the quantity of timber is however increasing. The appearances of minerals continue as usual, and to-day we found several stones which seemed to have been wood, first carbonated and then petrified by the water of the Missouri, which has the same effect on many vegetable substances. There is, indeed, reason to believe that the strata of coal in the hills cause the fire and appearances which they exhibit of being burned. Whenever these marks present themselves in the bluffs on the river, the coal is seldom seen, and when found in the neighbourhood of the strata of burnt earth, the coal with the sand and sulphureous matter usually accompanying it, is precisely at the same height, and nearly of the same thickness with those strata. We passed three small creeks or rather runs, which rise in the hills to the north. Numbers of geese, and a few ducks chiefly of the mallard and bluewinged teal, many buffaloe, elk, and deer were also observed, and in the timbered low grounds this morning we were surprised to observe a great quantity of old hornets' nests: we encamped in a point of woods on the south.

having come eighteen miles, though the circuit which we were obliged to make round sandbars very much increased the real distance.

Wednesday, April 17. We set off early, the weather being fine, and the wind so favourable as to enable us to sail the greater part of the course. At ten and three quarter miles we passed a creek ten yards wide on the south; at eighteen miles a little run on the north, and at night encamped in a woody point on the south. We had travelled twenty-six miles through a country similar to that of yesterday, except that there were greater appearances of burnt hills, furnishing large quantities of lava and pumicestone, of the last of which we observe some pieces floating down the river, as we had previously done, as low as the Little Missouri. In all the copses of wood are the remains of the Assiniboin encampments; around us are great quantities of game, such as herds of buffaloe, elk, antelopes, some deer, and wolves, the tracks of bears; a curlew was also seen, and we obtained three beaver, the flesh of which is more relished by the men than any other food which we have. Just before we encamped we saw some tracks of Indians, who had passed twenty-four hours before, and left four rafts, and whom we supposed to be a band of Assiniboins on their return from war against the Indians on the Rocky mountains.

Thursday 18. We had again a pleasant day, and proceeded on with a westerly wind, which however changed to N.W. and blew so hard that

we were obliged to stop at one o'clock and remain four hours, when it abated and we then continued our course.

We encamped about dark on a woody bank, having made thirteen miles. The country presented the usual variety of highlands interspersed with rich plains. In one of these we observed a species of pea bearing a yellow flower, which is now in blossom, the leaf and stalk resembling the common pea. It seldom rises higher than six inches, and the root is perennial. On the rose bushes we also saw a quantity of the hair of the buffaloe, which had become perfectly white by exposure, and resembled the wool of the sheep, except that it was much finer and more soft and silky. A buffaloe which we killed yesterday had shed his long hair, and that which remained was about two inches long, thick, fine, and would have furnished five pounds of wool, of which we have no doubt an excellent cloth may be made. Our game to-day was a beaver, a deer, an elk, and some geese. The river has been crooked all day and bearing towards the south.

On the hills we observed considerable quantities of dwarf juniper, which seldom grows higher than three feet. We killed in the course of the day an elk, three geese, and a beaver. The beaver on this part of the Missouri are in greater quantities, larger and fatter, and their fur is more abundant and of a darker colour than any we had hitherto seen: their favourite food seems to be the bark of the cottonwood and willow, as we have seen no other species

of tree that has been touched by them, and these they gnaw to the ground through a diameter of twenty inches.

The next day, Friday, 19th, the wind was so high from the north-west that we could not proceed, but being less violent on

Saturday, 20th, we set off about seven o'clock, and had nearly lost one of the canoes as we left the shore, by the falling in of a large part of the bank. The wind too became again so strong that we could scarcely make one mile an hour, and the sudden squalls so dangerous to the small boats, that we stopped for the night among some willows on the north, not being able to advance more than six and a half miles. In walking through the neighbouring plains we found a fine fertile soil, covered with cottonwood, some box, alder, ash, red elm, and an undergrowth of willow, rosebushes, honeysuckle, red willow, gooseberry, currant, and serviceberries, and along the foot of the hills great quantities of hyssop. Our hunters procured elk and deer, which are now lean, and six beaver which are fatter and more palatable. Along the plain there were also some Indian camps; near one of these was a scaffold about seven feet high, on which were two sleds with their harness, and under it the body of a female, carefully wrapped in several dressed buffaloe skins; near it lay a bag made of buffaloe skin, containing a pair of moccasins, some red and blue paint, beaver's nails, scrapers for dressing hides, some dried roots, several plaits of sweet grass, and a small quantity

of Mandan tobacco. These things, as well as the body itself, had probably fallen down by accident, as the custom is to place them on the scaffold. At a little distance was the body of a dog not yet decayed, who had met this reward for having dragged thus far in the sled the corpse of his mistress, to whom, according to the Indian usage, he had been sacrificed.

Sunday, 21st. Last night there was a hard white frost, and this morning the weather cold, but clear and pleasant: in the course of the day however it became cloudy and the wind rose. The country is of the same description as within the few last days. We saw immense quantities of buffaloe, elk, deer, antelopes, geese, and some swan and ducks, out of which we procured three deer and four buffaloe calves, which last are equal in flavour to the most delicious veal: also two beaver, and an otter. We passed one large and two small creeks on the south side, and reached at sixteen miles the mouth of White-earth river, coming in from the north. This river, before it reaches the low grounds near the Missouri, is a fine bold stream sixty yards wide, and is deep and navigable, but it is so much choked up at the entrance by the mud of the Missouri, that its mouth is not more than ten yards wide. Its course, as far we could discern from the neighbouring hills, is nearly due north, passing through a beautiful and fertile valley, though without a tree or bush of any description. Half a mile beyond this river we en-

camped on the same side below a point of highland, which from its appearance we called Cut bluff.

Monday, 22d. The day clear and cold: we passed a high bluff on the north and plains on the south, in which were large herds of buffaloe, till breakfast, when the wind became so strong a-head that we proceeded with difficulty even with the aid of the towline. Some of the party now walked across to the White-earth river, which here, at the distance of four miles from its mouth, approaches very near to the Missouri. It contains more water than is usual in streams of the same size at this season, with steep banks, about ten or twelve feet high, and the water is much clearer than that of the Missouri; the salts which have been mentioned as common on the Missouri, are here so abundant that in many places the ground appears perfectly white, and from this circumstance it may have derived its name; it waters an open country, and is navigable almost to its source, which is not far from the Saskaskawan, and judging from its size and course, it is probable that it extends as far north as the fiftieth degree of latitude. After much delay in consequence of the high wind, we succeeded in making eleven miles, and encamped in a low ground on the south, covered with cottonwood and rabbitberries. The hills of the Missouri, near this place, exhibit large irregular broken masses of rocks and stones, some of which, although two hundred feet above the river, seem at some remote period to have been subject to its influence, being

apparently worn smooth by the agitation of the water. These rocks and stones consist of white and grey granite, a brittle black rock, flint, limestone, freestone, some small specimens of an excellent pebble, and occasionally broken strata of a black-coloured stone, like petrified wood, which make good whetstones. The usual appearances of coal, or carbonated wood, and pumicestone still continue, the coal being of a better quality, and when burnt, affords a hot and lasting fire, emitting very little smoke or flame. There are large herds of deer, elk, buffaloe, and antelopes in view of us: the buffaloe are not so shy as the rest, for they suffer us to approach within one hundred yards before they run, and then stop and resume their pasture at a very short distance. The wolves to-day pursued a herd of them, and at length caught a calf that was unable to keep up with the rest; the mothers on these occasions defending their young as long as they can retreat as fast as the herd, but seldom returning any distance to seek for them.

Tuesday, 23. A clear and pleasant morning, but at nine o'clock the wind became so high that the boats were in danger of upsetting: we therefore were forced to stop at a place of safety till about five in the afternoon, when the wind being lower we proceeded and encamped on the north at the distance of thirteen and a half miles: the party on shore brought us a buffaloe calf and three black-tailed deer: the sand on the river has the same appearances as usual, but the quantity of wood increases.

Wednesday, 24. The wind blew so high during the whole day that we were unable to move; such indeed was its violence, that although we were sheltered by high timber, the waves wetted many articles in the boats: the hunters went out and returned with four deer, two elk, and some young wolves, of the small kind. The party are very much afflicted with sore eyes, which we presume are occasioned by the vast quantities of sand which are driven from the sandbars in such clouds, as often to hide from us the view of the opposite bank. The particles of this sand are so fine and light that it floats for miles in the air, like a column of thick smoke, and is so penetrating that nothing can be kept free from it, and we are compelled to eat, drink, and breathe it very copiously. To the same cause we attribute the disorder of one of our watches, although her cases are double and tight; since without any defect in its works, that we can discover, it will not run for more than a few minutes without stopping.

Thursday 25. The wind moderated this morning, but was still high; we therefore set out early, the weather being so cold that the water froze on the oars as we rowed, and about ten o'clock the wind increased so much that we were obliged to stop. This detention from the wind, and the reports from our hunters of the crookedness of the river, induced us to believe that we were at no great distance from the Yellowstone river. In order therefore to prevent delay as much as possible, Captain Lewis de-

terminated to go on by land in search of that river, and make the necessary observations, so as to be enabled to proceed on immediately after the boats should join him: he therefore landed about eleven o'clock on the south side, accompanied by four men; the boats were prevented from going until five in the afternoon, when they went on a few miles further and encamped for the night, at the distance of fourteen and a half miles.

Friday, 26. We continued our voyage in the morning, and by twelve o'clock encamped at eight miles distance, at the junction of the Missouri and Yellowstone rivers; where we were soon joined by Captain Lewis.

On leaving us yesterday he pursued his route along the foot of the hills, which he ascended at the distance of eight miles; from these the wide plains, watered by the Missouri and the Yellowstone, spread themselves before the eye, occasionally varied with the wood of the banks, enlivened by the irregular windings of the two rivers, and animated by vast herds of buffaloe, deer, elk, and antelope. The confluence of the two rivers was concealed by the wood, but the Yellowstone itself was only two miles distant to the south. He therefore descended the hills and encamped on the bank of the river, having killed as he crossed the plain four buffaloes; the deer alone are shy and retire to the woods, but the elk, antelope, and buffaloe, suffered him to approach them without alarm, and often followed him quietly for some distance. This morning he sent

a man up the river to examine it, while he proceeded down to the junction: the ground on the lower side of the Yellowstone near its mouth, is flat, and for about a mile seems to be subject to inundation, while that at the point of junction, as well as on the opposite side of the Missouri, is at the usual height of ten or eighteen feet above the water, and therefore not overflowed. There is more timber in the neighbourhood of this place, and on the Missouri, as far below as the White-earth river, than on any other part of the Missouri on this side of the Chayenne: the timber consists principally of cottonwood, with some small elm, ash, and box alder. On the sandbars, and along the margin of the river, grows the small-leaved willow; in the low grounds adjoining are scattered rosebushes three or four feet high, the redberry, serviceberry, and redwood. The higher plains are either immediately on the river, in which case they are generally timbered, and have an undergrowth like that of the low grounds, with the addition of the broad-leaved willow, gooseberry, chokecherry, purple currant, and honeysuckle: or they are between the low grounds and the hills, and for the most part without wood or any thing except large quantities of wild hyssop; this plant rises about two feet high, and, like the willow of the sandbars, is a favourite food of the buffaloe, elk, deer, grouse, porcupine, hare, and rabbit. This river, which had been known to the French as the Roche jaune, or as we have called it the Yellowstone, rises according to Indian information in the Rocky mountains; its

sources are near those of the Missouri and the Platte, and it may be navigated in canoes almost to its head. It runs first through a mountainous country, but in many parts fertile and well timbered; it then waters a rich delightful land, broken into vallies and meadows, and well supplied with wood and water till it reaches near the Missouri open meadows and low grounds, sufficiently timbered on its borders. In the upper country its course is represented as very rapid, but during the two last and largest portions, its current is much more gentle than that of the Missouri, which it resembles also in being turbid, though with less sediment. The man who was sent up the river, reported in the evening that he had gone about eight miles, that during that distance the river winds on both sides of a plain four or five miles wide, that the current was gentle and much obstructed by sandbars, and at five miles he had met with a large timbered island, three miles beyond which a creek falls in on the S. E. above a high bluff, in which are several strata of coal. The country, as far as he could discern, resembled that of the Missouri, and in the plain he met several of the bighorn animals, but they were too shy to be obtained. The bed of the Yellowstone, as we observed it near the mouth, is composed of sand and mud, without a stone of any kind. Just above the confluence we measured the two rivers, and found the bed of the Missouri five hundred and twenty yards wide, the water occupying only three hundred and thirty, and the channel

deep: while the Yellowstone, including its sandbar, occupied eight hundred and fifty-eight yards, and two hundred and ninety-seven yards of water: the deepest part of the channel is twelve feet, but the river is now falling and seems to be nearly at its summer height.

April 27. We left the mouth of the Yellowstone. From the point of junction a wood occupies the space between the two rivers, which at the distance of a mile come within two hundred and fifty yards of each other. There a beautiful low plain commences, and widening as the rivers recede, extends along each of them for several miles, rising, about half a mile from the Missouri, into a plain twelve feet higher than the bed of the river. The low plain is a few inches above high water mark, and where it joins the higher plain there is a channel of sixty or seventy yards in width, through which a part of the Missouri, when at its greatest height, passes into the Yellowstone. At two and a half miles above the junction, and between the high and low plain, is a small lake, two hundred yards wide, extending for a mile parallel with the Missouri along the edge of the upper plain. At the lower extremity of this lake, about four hundred yards from the Missouri, and twice that distance from the Yellowstone, is a situation highly eligible for a trading establishment; it is in the high plain, which extends back three miles in width, and seven or eight miles in length, along the Yellowstone, where it is bordered by an extensive body of wood.

land, and along the Missouri with less breadth, till three miles above it is circumscribed by the hills within a space four yards in width. A sufficient quantity of limestone for building may easily be procured near the junction of the rivers: it does not lie in regular strata, but is in large irregular masses, of a light colour and apparently of an excellent quality. Game too is very abundant, and as yet quite gentle; above all, its elevation recommends it as preferable to the land at the confluence of the rivers, which their variable channels may render very insecure. The N.W. wind rose so high at eleven o'clock, that we were obliged to stop till about four in the afternoon, when we proceeded till dusk. On the south a beautiful plain separates the two rivers, till at about six miles there is a timbered piece of low ground, and a little above it bluffs, where the country rises gradually from the river; the situations on the north more high and open. We encamped on that side, the wind, the sand which it raised, and the rapidity of the current, having prevented our advancing more than eight miles: during the latter part of the day the river became wider and crowded with sandbars: although the game is in such plenty we killed only what is necessary for our subsistence. For several days past we have seen great numbers of buffaloe lying dead along the shore, and some of them partly devoured by the wolves: they have either sunk through the ice during the winter, or been drowned in attempting to cross,

or else, after crossing to some high bluff, found themselves too much exhausted either to ascend or swim back again, and perished for want of food; in this situation we found several small parties of them. There are geese too in abundance, and more bald-eagles than we have hitherto observed; the nests of these last being always accompanied by those of two or three magpies, who are their inseparable attendants.

CHAPTER VIII.

UNUSUAL APPEARANCE OF SALT — THE FORMIDABLE CHARACTER OF THE WHITE BEAR — PORCUPINE RIVER DESCRIBED — BEAUTIFUL APPEARANCE OF THE SURROUNDING COUNTRY — IMMENSE QUANTITIES OF GAME — MILK RIVER DESCRIBED — EXTRAORDINARY CHARACTER OF BIG DRY RIVER — AN INSTANCE OF UNCOMMON TENACITY OF LIFE IN A WHITE BEAR — NARROW ESCAPE OF ONE OF THE PARTY FROM THAT ANIMAL — A STILL MORE REMARKABLE INSTANCE — MUSCLESHELL RIVER DESCRIBED.

SUNDAY, 28. The day was clear and pleasant, and the wind having shifted to south-east, we could employ our sails, and went twenty-four miles to a low ground on the north, opposite to steep bluffs: the country on both sides is much broken, the hills approaching nearer to the river, and forming bluffs, some of a white and others of a red colour, and exhibiting the usual appearances of minerals, and some burnt hills, though without any pumicestone: the salts are in greater quantities than usual, and the banks and sandbars are covered with a white incrustation like frost. The low grounds are level, fertile, and partially timbered, but are not so wide as for a few days past. The woods are now green, but the plains and meadows

seem to have less verdure than those below: the only streams which we met to-day are two small runs on the north and one on the south, which rise in the neighbouring hills, and have very little water. At the distance of eighteen miles the Missouri makes a considerable bend to the south-east: the game is very abundant, the common, and mule or black-tailed deer, elk, buffaloe, antelope, brown bear, beaver, and geese. The beaver have committed great devastation among the trees, one of which, nearly three feet in diameter, had been gnawed through by them.

Monday, 29. We proceeded early with a moderate wind: Captain Lewis, who was on shore with one hunter, met about eight o'clock two white bears. Of the strength and ferocity of this animal, the Indians had given us dreadful accounts: they never attack him but in parties of six or eight persons, and even then are often defeated with the loss of one or more of their number. Having no weapons but bows and arrows, and the bad guns with which the traders supply them, they are obliged to approach very near to the bear; and as no wound except through the head or heart is mortal, they frequently fall a sacrifice if they miss their aim. He rather attacks than avoids a man, and such is the terror which he has inspired, that the Indians who go in quest of him, paint themselves and perform all the superstitious rites customary when they make war on a neighbouring nation. Hitherto those we had seen did not appear desirous of

encountering us, but although to a skilful rifleman the danger is very much diminished, yet the white bear is still a terrible animal. On approaching these two, both Captain Lewis and the hunter fired and each wounded a bear: one of them made his escape; the other turned upon Captain Lewis and pursued him seventy or eighty yards, but being badly wounded he could not run so fast as to prevent him from reloading his piece, which he again aimed at him, and a third shot from the hunter brought him to the ground: he was a male not quite full grown, and weighed about three hundred pounds: the legs are somewhat longer than those of the black bear, and the talons and tusks much larger and longer. The testicles are also placed much farther forward, and suspended in separate pouches from two to four inches asunder, while those of the black bear are situated back between the thighs, and in a single pouch like those of the dog: its colour is a yellowish brown, the eyes small, black, and piercing; the front of the fore legs near the feet is usually black, and the fur is finer, thicker, and deeper than that of the black bear: add to which, it is a more furious animal, and very remarkable for the wounds which it will bear without dying.

We are surrounded with deer, elk, buffaloe, antelopes, and their companions the wolves, who have become more numerous and make great ravages among them: the hills are here much more rough and high, and almost overhang the banks of the

river. There are greater appearances of coal than we have hitherto seen, the strata of it being in some places six feet thick, and there are strata of burnt earth, which are always on the same level with those of coal. In the evening, after coming twenty-five miles we encamped at the entrance of a river which empties itself into a bend on the north side of the Missouri: this stream, which we called Martha's river, is about fifty yards wide, with water for fifteen yards, the banks are of earth, and steep, though not high, and the bed principally of mud. Captain Clarke, who ascended it for three miles, found that it continued of the same width, with a gentle current, and pursuing its course about north 30° west, through an extensive, fertile, and beautiful valley, but without a single tree. The water is clear, and has a brownish yellow tint. At this place the highlands, which yesterday and to-day had approached so near the river, became lower, and, receding from the water, left a valley seven or eight miles wide.

Tuesday, 30. The wind was high from the north during the last evening, and continued so this morning: we however advanced, and found the river more winding than usual, and with a number of sand islands and bars, on one of which last we encamped at the distance of twenty-four miles. The low grounds are fertile and extensive, but with very little timber, and that cottonwood, very bad of its kind, being too small for planks, broken and dead at the top, and unsound in the centre of the

trunk. We passed some ancient lodges of drift-wood; which do not appear to have been lately inhabited. The game continues abundant: we killed the largest male elk we have yet seen; on placing it in its natural erect position, we found that it measured five feet three inches from the point of the hoof to the top of the shoulder. The antelopes are yet lean, and the females are with young: this fleet and quick-sighted animal is generally the victim of its curiosity: when they first see the hunters they run with great velocity; if he lies down on the ground and lifts up his arm, his hat, or his foot, the antelope returns on a light trot to look at the object, and sometimes goes and returns two or three times till it approaches within reach of the rifle: so too they sometimes leave their flock to go and look at the wolves who crouch down, and if the antelope be frightened at first, repeat the same manœuvre, and sometimes relieve each other till they decoy it from the party, when they seize it. But generally the wolves take them as they are crossing the rivers, for although swift of foot they are not good swimmers.

Wednesday, May 1. The wind was in our favour, and we were enabled to use the sails till twelve o'clock, when the wind became so high and squally that we were forced to come to at the distance of ten miles on the south, in a low ground stocked with cottonwood, and remain there during the day; one of the canoes being separated from us, and not able to cross over in consequence of

the high waves. The country around is more pleasant than that through which we had passed for several days, the hills being lower, the low grounds wider, and better supplied with timber, which consists principally of cottonwood: the undergrowth willow on the banks and sandbars, rosebushes, red willow, and the broad leafed willow in the low plains, while the high country, on both sides, is one extensive plain without wood, though the soil is a dark, rich, mellow loam. Our hunters killed a buffaloe, an elk, a goat, and two beaver, and also a bird of the plover kind.

Thursday, 2d. The wind continued high during the night, and at day-light it began to snow, and did not stop till ten o'clock, when the ground was covered an inch deep, forming a striking contrast with the vegetation which is now considerably advanced; some flowers having put forth, and the cottonwood leaves as large as a dollar. The wind lulled about five o'clock in the afternoon, and we then proceeded along wide fertile low grounds and high level plains, and encamped at the distance of four miles. Our game to-day was deer, elk, and buffaloe: we also procured three beaver who are quite gentle, as they have not been hunted, but when the hunters are in pursuit, they never leave their huts during the day: this animal we esteem a great delicacy, particularly the tail, which, when boiled, resembles in flavour the flesh tongues and sounds of the cod-fish, and is generally so large as to afford a plentiful meal for two men. One of

the hunters, in passing near an old Indian camp, found several yards of scarlet cloth, suspended on the bough of a tree, as a sacrifice to the deity by the Assiniboin: the custom of making these offerings being common among that people, as indeed among all the Indians on the Missouri. The air was sharp this evening; the water froze on the oars as we rowed, and in the morning,

Friday, 3d, the weather became quite cold, the ice a quarter of an inch thick in the kettle, and the snow still continued on the hills, though it has melted from the plains. The wind too continued high from the west, but not so violently as to prevent our going on. At two miles from our encampment we passed a curious collection of bushes, about thirty feet high, and ten or twelve in diameter, tied in the form of a fascine, and standing on end in the middle of the low ground: this too we supposed to have been left by the Indians as a religious sacrifice: at twelve o'clock, the usual hour, we halted for dinner. The low grounds on the river are much wider than common, sometimes extending from five to nine miles to the highlands, which are much lower than heretofore, not being more than fifty or sixty feet above the lower plain: through all this valley traces of the ancient bed of the river are everywhere visible, and since the hills have become lower, the strata of coal, burnt-earth, and pumice-stone, have in a great measure ceased, there being in fact none to-day. At the distance of fourteen miles we reached the mouth of a river on the north,

which, from the unusual number of porcupines near it, we called Porcupine river, this is a bold and beautiful stream, one hundred and twelve yards wide, though the water is only forty yards at its entrance: Captain Clarke, who ascended it several miles, and passed it above where it enters the highlands, found it continued nearly of the same width and about knee deep, and as far as he could distinguish for twenty miles from the hills, its course was from a little to the east of north. There was much timber on the low grounds: he found some limestone also on the surface of the earth in the course of his walk, and saw a range of low mountains at a distance to the west of north, whose direction was north-west; the adjoining country being every where level, fertile, open, and exceedingly beautiful. The water of this river is transparent, and is the only one that is so of all those that fall into the Missouri: before entering a large sandbar, through which it discharges itself, its low grounds are formed of a stiff blue and black clay, and its banks, which are from eight to ten feet high, and seldom if ever overflow, are composed of the same materials. From the quantity of water which this river contains, its direction, and the nature of the country through which it passes, it is not improbable that its sources may be near the main body of the Saskaskawan, and as in high water it can be no doubt navigated to a considerable distance, it may be rendered the means of intercourse with the Athabasky country, from

which the North-West Company derive so many of their valuable furs.

A quarter of a mile beyond this river a creek falls in on the south, to which, on account of its distance from the mouth of the Missouri, we gave the name of Two-thousand mile creek: it is a bold stream with a bed thirty yards wide. Three miles and a half above Porcupine river, we reached some high timber on the north, and encamped just above an old channel of the river, which is now dry. We saw vast quantities of buffalo, elk, deer, principally of the long-tailed kind, antelopes, beaver, geese, ducks, brant, and some swan. The porcupines too are numerous, and so careless and clumsy that we can approach very near without disturbing them as they are feeding on the young willows: towards evening we also found, for the first time, the nest of a goose among some driftwood, all that we have hitherto seen being on the top of a broken tree on the forks, and invariably from fifteen to twenty feet or more in height.

Saturday, 4. We were detained till nine in order to repair the rudder of one of the boats, and when we set out the wind was a-head; and at six and a half miles we passed a small creek in a deep bend on the south, with a sand island opposite to it, and then passing along an extensive plain, which gradually rises from the north side of the river, encamped at the distance of eighteen miles, in a point of woodland on the north: the river is this day wider than usual, and crowded

with sandbars on all sides: the country is level, fertile and beautiful, the low grounds extensive, and contain a much greater portion of timber than is common. Indeed all the forepart of the day the river was bordered with timber on both sides, a circumstance very rare on the Missouri, and the first that has occurred since we left the Mandans. There are as usual vast quantities of game, and extremely gentle; the male buffalo particularly will scarcely give way to us, and as we approach will merely look at us for a moment, as something new, and then quietly resume their feeding. In the course of the day we passed some old Indian hunting camps, one of which consisted of two large lodges, fortified with a circular fence, twenty or thirty feet in diameter, and made of timber laid horizontally, the beams overlaying each other to the height of five feet, and covered with the trunks and limbs of trees that have drifted down the river: the lodges themselves are formed by three or more strong sticks, about the size of a man's leg or arm, and twelve feet long, which are attached at the top by a withe of small willows, and spreading out so as to form at the base, a circle of ten or fourteen feet in diameter: against these are placed pieces of driftwood and fallen timber, usually in three ranges one on the other, and the interstices are covered with leaves, bark, and straw, so as to form a conical figure about ten feet high, with a small aperture in one side for the door. It is, however, at best, a very imperfect shelter against the inclemencies of the seasons.

Sunday, 5. We had a fine morning, and the wind being from the east we used our sails. At the distance of five miles we came to a small island, and twelve miles farther encamped on the north, at the distance of seventeen miles. The country, like that of yesterday, is beautiful in the extreme. Among the vast quantities of game around us, we distinguish a small species of goose, differing considerably from the common Canadian goose; its neck, head, and beak, being much thicker, larger, and shorter in proportion to its size, which is nearly a third smaller; the noise too resembling more that of the brant, or of a young goose that has not yet fully acquired its note: in other respects, in colour, habits, and the number of feathers in the tail, the two species correspond; this species also associates in flocks with the large geese, but we have not seen it pair off with them. The white brant is about the size of the common brown brant, or two-thirds of the common goose, than which it is also six inches shorter from the extremity of the wings, though the beak, head, and neck are larger and stronger: the body and wings are of a beautiful pure white, except the black feathers of the first and second joints of the wings; the beak and legs are of a reddish or flesh-coloured white, the eye of a moderate size, the pupil of a deep sea-green, encircled with a ring of yellowish brown, the tail consists of sixteen feathers equally long, the flesh is dark, and as well as its note differs but little from those of the common brant, whom in form and

habits it resembles, and with whom it sometimes unites in a common flock: the white brant also associate by themselves in large flocks, but as they do not seem to be mated or paired off, it is doubtful whether they reside here during the summer for the purpose of rearing their young.

The wolves are also very abundant, and are of two species. First, the small wolf or burrowing dog of the prairies, which are found in almost all the open plains. It is of an intermediate size between the fox and dog, very delicately formed, fleet and active. The ears are large, erect, and pointed, the head long and pointed like that of the fox; the tail long and bushy; the hair and fur of a pale reddish brown colour, though much coarser than that of the fox; the eye of a deep sea-green colour, small and piercing; the talons rather longer than those of the wolf of the Atlantic states, which animal, as far as we can perceive, is not to be found on this side of the river Platte. These wolves usually associate in bands of ten or twelve, and are rarely if ever seen alone, not being able singly to attack a deer or antelope. They live and rear their young in burrows, which they fix near some pass or spot much frequented by game, and sally out in a body against any animal which they think they can overpower, but on the slightest alarm retreat to their burrows, making a noise exactly like that of a small dog.

The second species is lower, shorter in the legs, and thicker than the Atlantic wolf; their colour, which is not affected by the seasons, is of every va-

riety of shade, from a grey or blackish brown to a cream coloured white. They do not burrow, nor do they bark, but howl, and they frequent the woods and plains, and skulk along the skirts of the buffaloe herds, in order to attack the weary or wounded.

Captain Clarke and one of the hunters met this evening the largest brown bear we have seen. As they fired he did not attempt to attack, but fled with a most tremendous roar, and such was his extraordinary tenacity of life, that although he had five balls passed through his lungs, and five other wounds, he swam more than half across the river to a sandbar, and survived twenty minutes. He weighed between five and six hundred pounds at least, and measured eight feet seven inches and a half from the nose to the extremity of the hind feet, five feet ten inches and a half round the breast, three feet eleven inches round the neck, one foot eleven inches round the middle of the fore-leg, and his talons, five on each foot, were four inches and three-eighths in length. It differs from the common black bear in having its talons much longer and more blunt; its tail shorter; its hair of a reddish or bay brown, longer, finer, and more abundant; his liver, lungs, and heart, much larger even in proportion to his size, the heart particularly being equal to that of a large ox; his maw ten times larger; his testicles pendent from the belly and in separate pouches four inches a part: besides fish and flesh, he feeds on roots, and every kind of wild fruit.

The antelope are now lean and with young, so that they may readily be caught at this season, as they cross the river from S. W. to N. E.

Monday, 6. The morning being fair and the wind favourable, we set sail and proceeded on very well the greater part of the day. The country continues level, rich, and beautiful; the low grounds wide and comparatively with the other parts of the Missouri, well supplied with wood. The appearances of coal, pumice-stone, and burnt earth have ceased, though the salts of tartar or vegetable salts continue on the banks and sandbars, and sometimes in the little ravines at the base of the low hills. We passed three streams on the south; the first at the distance of one mile and a half from our camp, was about twenty-five yards wide, but although it contained some water in standing pools, it discharges none; this we called Little dry creek: about eight miles beyond which, is Big dry creek, fifty yards wide, without any water; the third is six miles further, and has the bed of a large river two hundred yards wide, yet without a drop of water: like the other two, this stream, which we called Big dry river, continues its width undiminished as far as we can discern. The banks are low, the channel formed of a fine brown sand, intermixed with a small proportion of little pebbles of various colours, and the country around flat and without trees. They had recently discharged their waters, and from their appearance and the nature of the country through which they

pass, we concluded that they rose in the Black mountains, or in the level low plains which are probably between this place and the mountains; that the country being nearly of the same kind, and of the same latitude, the rains of spring melting the snows about the same time, conspire with them to throw at once vast quantities of water down these channels, which are then left dry during the summer, autumn, and winter, when there is very little rain. We had to-day a slight sprinkling, but it lasted a very short time. The game is in such plenty, that it has become a mere amusement to supply the party with provisions. We made twenty-five miles to a clump of trees on the north, where we passed the night.

Tuesday, 7. The morning was pleasant, and we proceeded at an early hour. There is much drift-wood floating, and what is contrary to our expectation, although the river is rising, the water is somewhat clearer than usual. At eleven o'clock the wind became so high, that one of the boats was nearly sunk, and we were obliged to stop till one, when we proceeded on, and encamped on the south, above a large sandbar projecting from the north, having made fifteen miles. On the north side of the river are the most beautiful plains we have yet seen; they rise gradually from the low grounds on the water, to the height of fifty or sixty feet, and then extend in an unbroken level as far as the eye can reach: the hills on the south are more broken and higher, though at some distance

back the country becomes level and fertile. There are no more appearances of burnt earth, coal, or pumice-stone, though that of salt still continues, and the vegetation seems to have advanced but little since the twenty-eighth of last month: the game is as abundant as usual. The bald-eagles, of whom we see great numbers, probably feed on the carcasses of dead animals, for on the whole Missouri, we have seen neither the blue-crested fisher, nor the fishing-hawks, to supply them with their favourite food, and the water of the river is so turbid that no bird which feeds exclusively on fish, can procure a subsistence.

Wednesday, 8. A light breeze from the east carried us sixteen miles, till we halted for dinner at the entrance of a river on the north. Captain Clarke, who had walked on the south, on ascending a high point opposite to its entrance, discovered a level and beautiful country which it watered; that its course for twelve or fifteen miles was N. W. when it divided into two nearly equal branches, one pursuing a direction nearly north, the other to the W. of N. W.; its width at the entrance is one hundred and fifty yards, and on going three miles up, Captain Lewis found it to be of the same breadth, and sometimes more; it is deep, gentle, and has a large quantity of water; its bed is principally of mud, the banks abrupt, about twelve feet in height, and formed of a dark, rich loam and blue clay; the low grounds near it are wide and fertile, and possess a considerable proportion of cotton-

wood and willow. It seems to be navigable for boats and canoes, and this circumstance joined to its course, and the quantity of water, which indicates that it passes through a large extent of country, we are led to presume that it may approach the Saskashawan, and afford a communication with that river. The water has a peculiar whiteness, such as might be produced by a tablespoon full of milk in a dish of tea, and this circumstance induced us to call it Milk river. In the evening we had made twenty-seven miles, and encamped on the south. The country on that side consists in general of high broken hills, with much gray, black, and brown granite scattered over the surface of the ground. At a little distance from the river there is no timber on either side, the wood being confined as below to the margin of the river; so that unless the contrary is particularly mentioned, it is always understood that the upland is perfectly naked, and that we consider the low-grounds well timbered if even a fifth be covered with wood. The wild liquorice is found in great abundance on these hills, as is also the white apple. As usual we are surrounded by buffaloe, elk, common, and black-tailed deer, beaver, antelopes, and wolves. We observed a place where an Indian had recently taken the hair off an antelope's skin, and some of the party thought they distinguished imperfectly some smoke and Indian lodges up Milk river, marks which we are by no means desirous of realizing, as the Indians are probably Assiniboins, and might be very troublesome.

Thursday, 9. We again had a favourable wind and sailed along very well. Between four and five miles we passed a large island in a deep bend to the north, and a large sandbar at the upper point. At fifteen and a quarter miles we reached the bed of a most extraordinary river which presents itself on the south: though as wide as the Missouri itself, that is about half a mile, it does not discharge a drop of water, and contains nothing but a few standing pools. On ascending it three miles we found an eminence from which we saw the direction of the channel, first south for ten or twelve miles, then turning to the east of south-east as far as we could see: it passes through a wide valley without timber, and the surrounding country consists of waving low hills interspersed with some handsome level plains; the banks are abrupt, and consist of a black or yellow clay, or of a rich, sandy loam, but though they do not rise more than six or eight feet above the bed, they exhibit no appearance of being overflowed: the bed is entirely composed of a light brown sand, the particles of which like those of the Missouri are extremely fine. Like the dry rivers we passed before, this seemed to have discharged its waters recently, but the watermark indicated that its greatest depth had not been more than two feet: this stream, if it deserve the name, we called Bigdry river. About a mile below is a large creek on the same side, which is also perfectly dry: the mineral salts and quartz are in large quantities near this neighbourhood. The sand of the Missouri from

its mouth to this place has been mixed with a substance which we had presumed to be a granulated talc, but which is most probably this quartz. The game is now in great quantities, particularly the elk and buffaloe, which last is so gentle that the men are obliged to drive them out of the way with sticks and stones. The ravages of the beaver are very apparent: in one place the timber was entirely prostrated for a space of three acres in front of the river, and one in depth, and great part of it removed, although the trees were in large quantities, and some of them as thick as the body of a man. At the distance of twenty-four miles we encamped, after making twenty-five and a half miles, at the entrance of a small creek in a bend on the north, to which we gave the name of Werner's creek, after one of our men.

For several days past the river has been as wide as it generally is near its mouth, but as it is much shallower, crowded with sandbars, and the colour of the water has become much clearer, we do not yet despair of reaching the Rock mountains, for which we are very anxious.

Friday, 10. We had not proceeded more than four and a quarter miles, when the violence of the wind forced us to halt for the day under some timber in a bend on the south side. The wind continued high, the clouds thick and black, and we had a slight sprinkling of rain several times in the course of the day. Shortly after our landing a dog came to us, and as this induced us to believe that we are

near the hunting grounds of the Assiniboin, who are a vicious ill-disposed people, it was necessary to be on our guard: we therefore inspected our arms, which we found in good order, and sent several hunters to scour the country, but they returned in the evening, having seen no tents, nor any recent tracks of Indians. Biles and imposthumes are very common among the party, and sore eyes continue in a greater or less degree with all of us; for the imposthumes we use emollient poultices, and apply to the eyes a solution of two grains of white vitriol, and one of sugar of lead, with one ounce of water.

Saturday, 11. The wind blew very hard in the night, but having abated this morning, we went on very well, till in the afternoon the wind arose and retarded our progress; the current too was strong, the river very crooked, and the banks as usual constantly precipitating themselves in large masses into the water. The highlands are broken and approach nearer the river than they do below. The soil however of both hills and low grounds appears as fertile as that further down the river: it consists of a black looking loam with a small portion of sand, which covers the hills and bluffs to the depth of twenty or thirty feet, and, when thrown into the water, dissolves as readily as loaf-sugar, and effervesces like marle: there are also great appearances of quartz and mineral salts: the first is most commonly seen in the faces of the bluffs, the second is found on the hills as well as the low grounds, and in the gullies which come down from the hills: it

lies in a crust of two or three inches in depth, and may be swept up with a feather in large quantities. There is no longer any appearance of coal, burnt earth, or pumicestone. We saw and visited some high hills on the north side, about three miles from the river, whose tops were covered with the pitch-pine: this is the first pine we have seen on the Missouri, and it is like that of Virginia, except that the leaves are somewhat longer: among this pine is also a dwarf cedar, sometimes between three and four feet high, but generally spreading itself like a vine along the surface of the earth, which it covers very closely, putting out roots from the under side. The fruit and smell resemble those of the common red cedar, but the leaf is finer and more delicate. The tops of the hills where these plants grow have a soil quite different from that just described; the basis of it is usually yellow or white clay, and the general appearance light coloured, sandy, and barren, some scattering tufts of sedge being almost its only herbage. About five in the afternoon one of our men who had been afflicted with biles, and suffered to walk on shore, came running to the boats with loud cries, and every symptom of terror and distress: for some time after we had taken him on board, he was so much out of breath as to be unable to describe the cause of his anxiety, but he at length told us that about a mile and a half below he had shot a brown bear, which immediately turned and was in close pursuit of him; but the bear being badly wounded could not overtake him. Captain

Lewis, with seven men immediately went in search of him, and having found his track, followed him by the blood for a mile, and found him concealed in some thick brushwood, and shot him with two balls through the skull. Though somewhat smaller than that killed a few days ago, he was a monstrous animal, and a most terrible enemy: our man had shot him through the centre of the lungs, yet he had pursued him furiously for half a mile, then returned more than twice that distance, and with his talons had prepared himself a bed in the earth, two feet deep and five feet long, and was perfectly alive when they found him, which was at least two hours after he received the wound. The wonderful power of life which these animals possess renders them dreadful: their very track in the mud or sand, which we have sometimes found eleven inches long and seven and a quarter wide, exclusive of the talons, is alarming; and we had rather encounter two Indians than meet a single brown bear. There is no chance of killing them by a single shot, unless the ball goes through the brains, and this is very difficult on account of two large muscles which cover the side of the forehead, and the sharp projection of the centre of the frontal bone, which is also thick. Our encampment was on the south, at the distance of sixteen miles from that of last night: the fleece and skin of the bear were a heavy burden for two men, and the oil amounted to eight gallons.

Sunday, 12th. The weather being clear and calm,

we set out early. Within a mile we came to a small creek about twenty yards wide, emptying itself on the south. At eleven and three quarter miles we reached a point of woodland on the south, opposite to which is a creek of the same width as the last, but with little water, which we called Pine creek. At eighteen and three quarter miles we came to on the south, opposite to the lower point of a willow island, situated in a deep bend of the river to the south-east: here we remained during the day, the wind having risen at twelve so high that we could not proceed: it continued to blow violently all night, with occasional sprinklings of rain from sunset till midnight. On both sides of the river the country is rough and broken, the low grounds becoming narrower; the tops of the hills on the north exhibit some scattered pine and cedar, on the south the pine has not yet commenced, though there is some cedar on the sides of the hills and in the little ravines. The chokecherry, the wild hyssop, sage, fleshy-leaved thorn, and particularly the aromatic herb on which the antelope and hare feed, are to be found on the plains and hills. The soil of the hills has now altered its texture considerably; their bases like that of the river plains, is as usual a rich, black loam, while from the middle to the summits they are composed of a light brown-coloured earth, poor and sterile, and intermixed with a coarse white sand.

Monday, 13th. The wind was so strong that we could not proceed till about one o'clock, when we

had to encounter a current rather stronger than usual. In the course of a mile and a half we passed two small creeks on the south, one of eighteen, the other of thirty yards width, but neither of them containing any water, and encamped on the south at a point of woodland, having made only seven miles. The country is much the same as yesterday, with little timber in the low grounds, and a small quantity of pine and cedar on the northern hills. The river however continues to grow clearer, and this, as well as the increased rapidity, induces us to hope for some change of country. The game is as usual so abundant, that we can get without difficulty all that is necessary.

Tuesday, 14th. There was some fog on the river this morning, which is a very rare occurrence. At the distance of a mile and a half we reached an island in a bend on the north, which continued for about half a mile, where at the head of it a large creek comes in on the north, to which we gave the name of Gibson's creek. At seven and a half miles is a point of rocks on the south, above a creek on the same side, which we called Sticklodge creek: five miles further is a large creek on the south, which, like the two others, has no running water: and at sixteen and a half miles a timbered point on the north, where we encamped for the night. The country is like that of yesterday, except that the low grounds are wider: there are also many high black bluffs along the banks: the game too is in great abundance. Towards evening the men in

the hindmost canoes discovered a large brown bear lying in the open grounds, about three hundred paces from the river: six of them, all good hunters, immediately went to attack him, and concealing themselves by a small eminence, came unperceived within forty paces of him: four of the hunters now fired, and each lodged a ball in his body, two of them directly through the lungs: the furious animal sprang up and ran open-mouthed upon them; as he came near, the two hunters who had reserved their fire gave him two wounds, one of which breaking his shoulder, retarded his motion for a moment; but before they could reload he was so near that they were obliged to run to the river, and before they reached it he had almost overtaken them: two jumped into the canoe; the other four separated, and concealing themselves in the willows, fired as fast as each could reload: they struck him several times, but instead of weakening the monster each shot seemed only to direct him towards the hunter, till at last he pursued two of them so closely, that they threw aside their guns and pouches, and jumped down a perpendicular bank of twenty feet into the river; the bear sprang after them, and was within a few feet of the hindmost, when one of the hunters on shore shot him in the head and finally killed him: they dragged him to the shore, and found that eight balls had passed through him in different directions; the bear was old and the meat tough, so that they took the skin only, and rejoined us at the camp, where we had been as much

terrified by an accident of a different kind. This was the narrow escape of one of our canoes containing all our papers, instruments, medicine, and almost every article indispensable for the success of our enterprize. The canoe being under sail, a sudden squall of wind struck her obliquely, and turned her considerably. The man at the helm, who was unluckily the worst steersman of the party, became alarmed, and instead of putting her before the wind luffed her up into it. The wind was so high that it forced the brace of the square-sail out of the hand of the man who was attending it, and instantly upset the canoe, which would have been turned bottom upwards, but for the resistance made by the awning. Such was the confusion on board, and the waves ran so high, that it was half a minute before she righted, and then nearly full of water, but by bailing out she was kept from sinking until they rowed ashore: besides the loss of the lives of three men, who, not being able to swim, would probably have perished, we should have been deprived of nearly every thing necessary for our purposes, at a distance of between two and three thousand miles from any place where we could supply the deficiency.

Wednesday, 15. As soon as a slight shower of rain had passed, we spread out the articles to dry; but the weather was so damp and cloudy that they derived little benefit from exposure. Our hunters procured us deer, buffaloe, and beaver.

Thursday, 16. The morning was fair, and we

were enabled to dry and repack our stores: the loss we sustained is chiefly in the medicines, many articles of which are completely spoiled, and others considerably injured. At four o'clock we embarked, and after making seven miles, encamped on the north near some wood: the country on both sides is broken, the low grounds narrower and with less timber, though there are some scattered pine and cedar on the steep declivities of the hills, which are now higher than usual. A white bear tore the coat of one of the men, which he had left on shore; two of the party wounded a large panther who was feasting on a deer. We caught some lean antelopes as they were swimming the river, and killed two buffaloe.

Friday, 17. We set out early and proceeded on very well; the banks being firm and the shore bold we were enabled to use the towline, which whenever the banks will permit it, is the safest and most expeditious mode of ascending the river, except under a sail with a steady breeze. At the distance of ten and a half miles we came to the mouth of a small creek on the south, below which the hills approach the river, and continue near it during the day: three miles further is a large creek on the north, and again six and three quarter miles beyond it, another large creek to the south, which contain a small quantity of running water of a brackish taste. The last we called Rattlesnake creek, from our seeing that animal near it. Although no timber can be observed on it from the Missouri, it throws out great quantities of driftwood, among

which were some pieces of coal brought down by the stream. We continued on one mile and a quarter, and encamped on the south, after making twenty and a half miles. The country in general is rugged, the hills high, with their summits and sides partially covered with pine and cedar, and their bases on both sides washed by the river: like those already mentioned, the lower part of these hills is of a dark rich loam, while the upper region, for one hundred and fifty feet, consists of a whitish brown sand, so hard as in many places to resemble stone, though in fact very little stone or rock of any kind is to be seen on the hills. The bed of the Missouri is much narrower than usual, being not more than between two and three hundred yards in width, with an uncommonly large proportion of gravel; but the sandbars, and low points covered with willows have entirely disappeared: the timber on the river consists of scarcely any thing more than a few scattered cottonwood trees. The saline incrustations along the banks and the foot of the hills are more abundant than usual. The game is in great quantities, but the buffaloe are not so numerous as they were some days ago: two rattlesnakes were seen to-day, and one of them killed: it resembles those of the middle Atlantic states, being about two feet six inches long, of a yellowish brown on the back and sides, variegated with a row of oval dark-brown spots lying transversely on the back from the neck to the tail, and two other rows of circular spots of the same colour on the sides along

the edge of the scuta : there are one hundred and seventy-six scuta on the belly, and seventeen on the tail. Captain Clarke saw in his excursions a fortified Indian camp, which appeared to have been recently occupied, and was, we presumed, made by a party of Minnetarees who went to war last March.

Late at night we were roused by the sergeant of the guard in consequence of a fire which had communicated to a tree overhanging our camp. The wind was so high, that we had not removed the camp more than a few minutes, when a large part of the tree fell precisely on the spot it had occupied, and would have crushed us if we had not been alarmed in time.

Saturday, 18. The wind continued high from the west, but by means of the towline we were able to make nineteen miles, the sandbars being now very few in number, the river narrow, and the current gentle ; the willow has in a great measure disappeared, and even the cotton-wood, almost the only timber remaining, is growing scarce. At twelve and three quarter miles we came to a creek on the north, which was perfectly dry. We encamped on the south, opposite the lower point of an island.

Sunday, 19. The last night was disagreeably cold ; and in the morning there was a very heavy fog, which obscured the river so much as to prevent our seeing the way. This is the first fog of any degree of thickness which we have experienced : there was also last evening a fall of dew,

the second which we have seen since entering this extensive open country. About eight o'clock the fog dispersed, and we proceeded with the aid of the towline : the island near which we were encamped, was three quarters of a mile in length. The country resembles that of yesterday, high hills closely bordering the river. In the afternoon the river became crooked, and contained more sawyers, or floating timber, than we have seen in the same space since leaving the Platte. Our game consisted of deer, beaver, and elk : we also killed a brown bear, who, although shot through the heart, ran at his usual pace nearly a quarter of a mile before he fell. At twenty-one miles is a willow island half a mile in length, on the north side, a quarter of a mile beyond which, is a shoal of rapid water under a bluff : the water continued very strong for some distance beyond it : at half a mile we came to a sandbar on the north, from which, to our place of encampment, was another half mile, making in all twenty-two and a quarter miles. The saline substances which we have mentioned, continue to appear : and the men are much afflicted with sore eyes and imposthumes.

Monday, 20. As usual we set out early, and the banks being convenient for that purpose, we used the towline : the river is narrow and crooked, the water rapid, and the country much like that of yesterday : at the distance of two and a quarter miles we passed a large creek with but little water, to which we gave the name of Blowingfly creek,

from the quantity of those insects found in its neighbourhood. They are extremely troublesome, infesting our meat whilst cooking, and at our meals. After making seven miles, we reached by eleven o'clock the mouth of a large river on the south, and encamped for the day at the upper point of its junction with the Missouri. This stream, which we suppose to be that called by the Minnetarees the Muscleshell river, empties into the Missouri two thousand two hundred and seventy miles above the mouth of the latter river, and in latitude $47^{\circ} 0' 24''$, 6 north. It is one hundred and ten yards wide, and contains more water than streams of that size usually do in this country; its current is by no means rapid, and there is every appearance of its being susceptible of navigation by canoes for a considerable distance: its bed is chiefly formed of coarse sand and gravel, with an occasional mixture of black mud; the banks abrupt, and nearly twelve feet high, so that they are secure from being overflowed; the water is of a greenish yellow cast, and much more transparent than that of the Missouri, which itself, though clearer than below, still retains its whitish hue and a portion of its sediment. Opposite to the point of junction the current of the Missouri is gentle, and two hundred and twenty-two yards in width, the bed principally of mud (the little sand remaining being wholly confined to the points) and still too deep to use the setting-pole. If this be, as we suppose, the Muscleshell, our Indian information is, that it

rises in the first chain of the rocky mountains, not far from the sources of the Yellowstone, whence in its course to this place it waters a high broken country, well timbered, particularly on its borders, and interspersed with handsome fertile plains and meadows. We have reason however to believe, from their giving a similar account of the timber where we now are, that the timber of which they speak is similar to that which we have seen for a few days past, which consists of nothing more than a few straggling small pine and dwarf cedar, on the summit of the hills, nine-tenths of the ground being totally destitute of wood, and covered with a short grass, aromatic herbs, and an immense quantity of prickly pears: though the party who explored it for eight miles, represented the low grounds on the river, as well supplied with cottonwood of a tolerable size, and of an excellent soil. They also reported that the country is broken and irregular like that near our camp; that about five miles up, a handsome river, about fifty yards wide, which we named after Chaboneau's wife, Sahcajah-weah, or Birdwoman's river, discharges itself into the Muscleshell on the north or upper side. Another party found at the foot of the southern hills, about four miles from the Missouri, a fine bold spring, which in this country is so rare, that since we left the Mandans, we have found only one of a similar kind, and that was under the bluffs on the south side of the Missouri, at some distance from it, and about five miles below the Yellow-

stone: with this exception, of all the small fountains which we have met, a number are impregnated with the salts which are so abundant here, and with which the Missouri is itself most probably tainted, though to us, who have been so much accustomed to it, the taste is not perceptible. Among the game to-day, we observed two large owls with remarkably long feathers, resembling ears on the sides of the head, which we presume are the hooting owls, though they are larger and their colours are brighter than those common in the United States.

Tuesday, 21. The morning being very fine we were able to employ the rope, and made twenty miles to our camp on the north. The shores of the river are abrupt, bold, and composed of a black and yellow clay, the bars being formed of black mud, and a small proportion of fine sand; the current strong. In its course the Missouri makes a sudden and extensive bend towards the south, to receive the waters of the Muscleshell. The neck of land thus formed, though itself high, is lower than the surrounding country, and makes a waving valley, extending for a great distance to the northward, with a fertile soil, which, though without wood, produces a fine turf of low grass, some herbs, and vast quantities of prickly pear. The country on the south is high, broken, and crowned with some pine and dwarf cedar; the leaf of this pine is longer than that of the common pitch or red pine of Virginia, the cone is longer and narrower, the im-

brications wider and thicker, and the whole frequently covered with resin. During the whole day the bends of the river are short and sudden; and the points covered with some cottonwood, large or broad-leaved willow, and a small quantity of redwood; the undergrowth consisting of wild roses, and the bushes of the small honeysuckle.

The mineral appearances on the river are as usual. We do not find the grouse or prairie hen so abundant as below, and think it probable that they retire from the river to the plains during this season.

The wind had been moderate during the fore part of the day, but continued to rise towards evening, and about dark veered to north-west, and blew a storm all night. We had encamped on a bar on the north, opposite the lower point of an island, which from this circumstance we called Windy island; but we were so annoyed by clouds of dust and sand, that we could neither eat nor sleep, and were forced to remove our camp at eight o'clock, to the foot of an adjoining hill, which shielded us in some degree from the wind: we procured elk, deer, and buffaloe.

Wednesday 22. The wind blew so violently that it was deemed prudent to wait till it had abated, so that we did not leave the camp till ten o'clock, when we proceeded principally by the towline. We passed Windy island which is about three quarters of a mile in length: and five and a half miles above it a large island in a bend to the north: three miles beyond this we came to the entrance of

a creek twenty yards wide, though with little water, which we called Grouse creek, from observing near its mouth a quantity of the prairie hen with pointed tails, the first we have seen in such numbers for several days: the low grounds are somewhat wider than usual, and apparently fertile, though the short and scanty grass on the hills does not indicate much richness of soil. The country around is not so broken as that of yesterday, but is still waving, the southern hills possessing more pine than usual, and some appearing on the northern hills, which are accompanied by the usual salt and mineral appearances.

The river continues about two hundred and fifty yards wide, with fewer sandbars, and the current more gentle and regular. Game is no longer in such abundance, since leaving the Muscleshell. We have caught very few fish on this side of the Mandans, and these were the white catfish of two to five pounds. We killed a deer and a bear: we have not seen in this quarter the black bear, common in the United States and on the lower parts of the Missouri, nor have we discerned any of their tracks, which may easily be distinguished by the shortness of its talons from the brown, grizzly, or white bear, all of which seem to be of the same family, which assumes those colours at different seasons of the year. We halted earlier than usual, and encamped on the north, in a point of woods, at the distance of sixteen and a half miles.

CHAPTER IX.

THE PARTY CONTINUE THEIR ROUTE — DESCRIPTION OF JUDITH RIVER — INDIAN MODE OF TAKING THE BUFFALOE — SLAUGHTER RIVER DESCRIBED — PHENOMENA OF NATURE — OF WALLS ON THE BANKS OF THE MISSOURI — THE PARTY ENCAMP ON THE BANKS OF THE RIVER TO ASCERTAIN WHICH OF THE STREAMS CONSTITUTED THE MISSOURI — CAPTAIN LEWIS LEAVES THE PARTY TO EXPLORE THE NORTHERN FORK, AND CAPTAIN CLARKE EXPLORES THE SOUTHERN — THE SURROUNDING COUNTRY DESCRIBED IN THE ROUTE OF CAPTAIN LEWIS — NARROW ESCAPE OF ONE OF HIS PARTY.

THURSDAY, 23. Last night the frost was severe, and this morning the ice appeared along the edges of the river, and the water froze on our oars. At the distance of a mile we passed the entrance of a creek on the north, which we named Teapot creek; it is fifteen yards wide, and although it has running water at a small distance from its mouth, yet it discharges none into the Missouri, resembling we believe, most of the creeks in this hilly country, the waters of which are absorbed by the thirsty soil near the river. They indeed afford but little water in any part, and even that is so strongly tainted with salts that it is unfit

for use, though all the wild animals are very fond of it. On experiment it was found to be moderately purgative, but painful to the intestines in its operation. This creek seems to come from a range of low hills, which run from east to west for seventy miles, and have their eastern extremity thirty miles to the north of Teapot creek. Just above its entrance is a large assemblage of the burrowing squirrels on the north side of the river. At nine miles we reached the upper point of an island in a bend on the south, and opposite the centre of the island, a small dry creek on the north. Half a mile further a small creek falls in on the same side; and six and a half miles beyond this another on the south. At four and a half miles we passed a small island in a deep bend to the north, and on the same side in a deep north-eastern bend of the river another small island. None of these creeks however possessed any water, and at the entrances of the islands, the two first are covered with tall cottonwood timber, and the last with willows only. The river has become more rapid, the country much the same as yesterday, except that there are rather more rocks on the face of the hills, and some small spruce pine appears among the pitch. The wild roses are very abundant and now in bloom; they differ from those of the United States only in having the leaves and the bush itself of a somewhat smaller size. We find the mosquitoes troublesome, notwithstanding the coolness of the morning. The buffaloe is scarce

to-day, but the elk, deer, and antelope, are very numerous. The geese begin to lose the feathers of the wings, and are unable to fly. We saw five bears, one of which we wounded, but in swimming from us across the river, he became entangled in some driftwood and sank. We formed our camp on the south, opposite to a hill, and a point of wood in a bend to the south, having made twenty-seven miles.

Friday, 24. The water in the kettles froze one-eighth of an inch during the night; the ice appears along the margin of the river, and the cottonwood-trees, which have lost nearly all their leaves by the frost, are putting forth other buds. We proceeded with the line principally till about nine o'clock, when a fine breeze sprung up from the S. E. and enabled us to sail very well, notwithstanding the rapidity of the current. At one mile and a half is a large creek, thirty yards wide, and containing some water which it empties on the north side, over a gravelly bed, intermixed with some stone. A man who was sent up to explore the country, returned in the evening, after having gone ten miles directly towards the ridge of mountains to the north, which is the source of this as well as of Teapot creek. The air of these highlands is so pure, that objects appear much nearer than they really are, so that although our man went ten miles without thinking himself by any means half way to the mountains, they do not from the river appear more than fifteen miles distant; this stream we

called Northmountain creek. Two and a half miles higher is a creek on the south, which is fifteen yards wide, but without any water, and to which we gave the name of Littledog creek, from a village of burrowing squirrels opposite to its entrance, that being the name given by the French watermen to those animals. Three miles from this a small creek enters on the north, five beyond which is an island a quarter of a mile in length, and two miles further a small river: this falls in on the south, is forty yards wide, and discharges a handsome stream of water; its bed rocky with gravel and sand, and the banks high: we called it Southmountain creek, as from its direction it seemed to rise in a range of mountains about fifty or sixty miles to the S. W. of its entrance. The low grounds are narrow and without timber; the country high and broken; a large portion of black rock, and brown sandy rock appears in the face of the hills, the tops of which are covered with scattered pine, spruce and dwarf cedar; the soil is generally poor, sandy near the tops of the hills, and nowhere producing much grass, the low grounds being covered with little else than the hyssop, or southern wood, and the pulpy-leaved thorn. Game is more scarce, particularly beaver, of which we have seen but few for several days, and the abundance or scarcity of which seems to depend on the greater or less quantity of timber. At twenty-four and a half miles we reached a point of woodland on the south, where we observed that the trees had no leaves,

and encamped for the night. The high country through which we have passed for some days, and where we now are, we suppose to be a continuation of what the French traders called the Cote Noire or Black hills. The country thus denominated, consists of high broken irregular hills and short chains of mountains, sometimes one hundred and twenty miles in width, sometimes narrower, but always much higher than the country on either side. They commence about the head of the Kansas, where they diverge; the first ridge going westward, along the northern shore of the Arkansaw; the second approaches the Rock mountains obliquely in a course a little to the W. of N. W., and after passing the Platte above its forks, and intersecting the Yellowstone near the Bigbend, crosses the Missouri at this place, and probably swells the country as far as the Saskashawan, though as they are represented much smaller here than to the south, they may not reach that river.

Saturday, 25. Two canoes which were left behind yesterday to bring on the game, did not join us till eight o'clock this morning, when we set out with the towline, the use of which the banks permitted. The wind was, however, a-head, the current strong, particularly round the points against which it happened to set, and the gullies from the hills having brought down large quantities of stone, these projected into the river, forming barriers for forty or fifty feet round, which it was very difficult to pass. At the distance of two and three quarter

miles we passed a small island in a deep bend on the south, and on the same side a creek twenty yards wide, but with no running water. About a mile further is an island between two and three miles in length, separated from the northern shore by a narrow channel, in which is a sand island at the distance of half a mile from its lower extremity. To this large island we gave the name of Teapot island; two miles above which is an island, a mile long, and situated on the south. At three and a half miles is another small island, and one mile beyond is a second, three quarters of a mile in length, on the north side. In the middle of the river two miles above this is an island with no timber, and of the same extent as this last. The country on each side is high, broken, and rocky; the rock being either a soft brown sandstone, covered with a thin stratum of limestone, or else a hard black rugged granite, both usually in horizontal strata, and the sandrock overlaying the other. Salts and quartz as well as some coal and pumicestone still appear: the bars of the river are composed principally of gravel; the river low grounds are narrow, and afford scarcely any timber; nor is there much pine on the hills. The buffaloe have now become scarce: we saw a polecat this evening, which was the first for several days: in the course of the day we also saw several herds of the big-horned animals among the steep cliffs on the north, and killed several of them. At the distance of

eighteen miles we encamped on the south, and the next morning,

Sunday, 26th, proceeded on at an early hour by means of the towline, using our oars merely in crossing the river, to take advantage of the best banks. There are now scarcely any low grounds on the river, the hills being high, and in many places pressing on both sides to the verge of the water. The black rock has given place to a very soft sandstone, which seems to be washed away fast by the river, and being thrown into the channel renders its navigation more difficult than it was yesterday: above this sandstone, and towards the summits of the hills, a hard freestone of a yellowish brown colour shows itself in several strata of unequal thickness, frequently overlaid or incrustated by a thin stratum of limestone, which seems to be formed of concreted shells. At eight and a quarter miles we came to the mouth of a creek on the north, thirty yards wide, with some running water and a rocky bed: we called it Windsor creek after one of the party. Four and three quarter miles beyond this we came to another creek in a bend to the north, which is twenty yards wide, with a handsome little stream of water: there is however no timber on either side of the river, except a few pines on the hills. Here we saw for the first time since we left the Mandans, several soft-shelled turtles, though this may be owing rather to the season of the year than to any scarcity of the animal. It was here that, after ascending the highest summits of the hills on

the north side of the river, that Captain Lewis first caught a distant view of the Rock mountains, the object of all our hopes, and the reward of all our ambition. On both sides of the river, and at no great distance from it, the mountains followed its course; above these, at the distance of fifty miles from us, an irregular range of mountains spread themselves from west to north-west from his position. To the north of these a few elevated points, the most remarkable of which bore north 65° west, appeared above the horizon, and as the sun shone on the snows of their summits, he obtained a clear and satisfactory view of those mountains which close on the Missouri the passage to the Pacific. Four and a half miles beyond this creek, we came to the upper point of a small sand island. At the distance of five miles, between high bluffs, we passed a very difficult rapid, reaching quite across the river, where the water is deep, the channel narrow, and gravel obstructing it on each side: we had great difficulty in ascending it, although we used both the rope and the pole, and doubled the crews: this is the most considerable rapid on the Missouri, and in fact the only place where there is a sudden descent. As we were labouring over them, a female elk with its fawn, swam down through the waves, which ran very high, and obtained for the place, the name of the Elk rapids. Just above them is a small low ground of cottonwood trees, where, at twenty-two and a quarter miles, we fixed our encamp-

ment, and were joined by Captain Lewis, who had been on the hills during the afternoon.

The country has now become desert and barren: the appearances of coal, burnt earth, pumice-stone, salts, and quartz, continue as yesterday: but there is no timber except the thinly scattered pine and spruce on the summits of the hills, or along the sides. The only animals we have observed are the elk, the bighorn, and the hare, common in this country. In the plain where we lie are two Indian cabins made of sticks, and during the last few days we have passed several others in the points of timber on the river.

Monday, 27. The wind was so high that we did not start till ten o'clock, and even then were obliged to use the line during the greater part of the day. The river has become very rapid with a very perceptible descent: its general width is about two hundred yards: the shoals too are more frequent, and the rocky points at the mouth of the gullies more troublesome to pass: great quantities of this stone lie in the river and on its banks, and seem to have fallen down as the rain washed away the clay and sand in which they were imbedded. The water is bordered by high rugged bluffs, composed of irregular but horizontal strata of yellow and brown or black clay, brown and yellowish white sand, soft yellowish white sandstone: hard dark brown freestone; and also large round kidney-formed irregular separate masses of a hard black iron-stone, imbedded in the clay and

sand; some coal or carbonated wood also makes its appearance in the cliffs, as do also its usual attendants, the pumice-stone and burnt earth. The salts and quartz are less abundant, and generally speaking, the country is, if possible, more rugged and barren than that we passed yesterday; the only growth of the hills being a few pine, spruce, and dwarf cedar, interspersed with an occasional contrast once in the course of some miles, of several acres of level ground, which supply a scanty subsistence for a few little cotton-wood trees.

Soon after setting out, we passed a small untimbered island on the south: at about seven miles we reached a considerable bend which the river makes towards the south-east, and in the evening, after making twelve and a half miles, encamped on the south near two dead cotton-wood trees, the only timber for fuel which we could discover in the neighbourhood.

Tuesday, 23. The weather was dark and cloudy; the air smoky, and there fell a few drops of rain. At ten o'clock we had again a slight sprinkling of rain, attended with distant thunder, which is the first we have heard since leaving the Mandans. We employed the line generally, with the addition of the pole at the ripples and rocky points, which we find more numerous and troublesome than those we passed yesterday. The water is very rapid round these points, and we are sometimes obliged to steer the canoes through the points of sharp rocks rising a few inches above the surface of the water, and

so near to each other, that if our ropes give way, the force of the current drives the sides of the canoe against them, and must inevitably upset them or dash them to pieces. These cords are very slender, being almost all made of elk-skin, and much worn, and rotted by exposure to the weather: several times they gave way, but fortunately always in places where there was room for the canoe to turn without striking the rock; yet with all our precautions it was with infinite risk and labour that we passed these points. An Indian pole for building floated down the river, and was worn at one end as if dragged along the ground in travelling; several other articles were also brought down by the current, which indicate that the Indians are probably at no great distance above us, and judging from a football which resembles those used by the Minnetarees near the Mandans, we conjectured that they must be a band of the Minnetarees of fort de Prairie. The appearance of the river and the surrounding country continued as usual, till towards evening, at about fifteen miles, we reached a large creek on the north, thirty-five yards wide, discharging some water, and named after one of our men, Thompson's creek. Here the country assumed a totally different aspect; the hills retired on both sides from the river, which now spreads to more than three times its former size, and is filled with a number of small handsome islands covered with cotton-wood. The low grounds on the river are again wide, fertile, and

enriched with trees; those on the north are particularly wide, the hills being comparatively low, and opening into three large vallies, which extend themselves for a considerable distance towards the north: these appearances of vegetation are delightful after the dreary hills among which we have passed, and we have now to congratulate ourselves at having escaped from the last ridges of the Black mountains. On leaving Thompson's creek we passed two small islands, and at twenty-three miles distance encamped among some timber on the north, opposite to a small creek, which we named Bull creek. The bighorn is in great quantities, and must bring forth their young at a very early season, as they are now half grown. One of the party saw a large bear also, but being at a distance from the river, and having no timber to conceal him, he would not venture to fire.

Wednesday, 29. Last night we were alarmed by a new sort of enemy. A buffalo swam over from the opposite side and to the spot where lay one of our canoes, over which he clambered to the shore; then taking fright he ran full speed up the bank towards our fires, and passed within eighteen inches of the heads of some of the men, before the sentinel could make him change his course: still more alarmed he ran down between four fires and within a few inches of the heads of a second row of the men, and would have broken into our lodge if the barking of the dog had not stopped him. He suddenly turned to the right and was out of

sight in a moment, leaving us all in confusion, every one seizing his rifle and inquiring the cause of the alarm. On learning what had happened, we had to rejoice at suffering no more injury than the damage to some guns which were in the canoe which the buffalo crossed.

In the morning early we left our camp, and proceeded as usual by the cord. We passed an island and two sandbars, and at the distance of two and a half miles we came to a handsome river which discharges itself on the south, and which we ascended to the distance of a mile and a half: we called it Judith's river: it rises in the Rock mountains in about the same place with the Muscleshell and near the Yellowstone river. Its entrance is one hundred yards wide from one bank to the other, the water occupying about seventy-five yards, and in greater quantity than that of the Muscleshell river, and though more rapid equally navigable, there being no stones or rocks in the bed, which is composed entirely of gravel and mud with some sand: the water too is clearer than any which we have yet seen; and the low grounds, as far as we could discern, wider and more woody than those of the Missouri: along its banks we observed some box-alder intermixed with the cottonwood and the willow; the undergrowth consisting of rosebushes, honeysuckles, and a little red willow. There was a great abundance of the argalea or bighorned animals in the high country through which it passes, and a great number of the beaver in its waters:

just above the entrance of it we saw the fires of one hundred and twenty-six lodges, which appeared to have been deserted about twelve or fifteen days, and on the other side of the Missouri a large encampment, apparently made by the same nation. On examining some moccasins which we found there, our Indian woman said that they did not belong to her own nation the Snake Indians, but she thought that they indicated a tribe on this side of the Rocky mountain, and to the north of the Missouri; indeed it is probable that these are the Minnetarees of fort de Prairie. At the distance of six and a half miles the hills again approach the brink of the river, and the stones and rocks washed down from them form a very bad rapid, with rocks and ripples more numerous and difficult than those we passed on the 27th and 28th: here the same scene was renewed, and we had again to struggle and labour to preserve our small craft from being lost. Near this spot are a few trees of the ash, the first we have seen for a great distance, and from which we named the place Ash Rapids. On these hills there is but little timber, but the salts, coal, and other mineral appearances continue. On the north we passed a precipice about one hundred and twenty feet high, under which lay scattered the fragments of at least one hundred carcasses of buffaloes, although the water which had washed away the lower part of the hill must have carried off many of the dead. These buffaloes had been chased down the precipice in a way very common

on the Missouri, and by which vast herds are destroyed in a moment. The mode of hunting is, to select one of the most active and fleet young men, who is disguised by a buffaloe skin round his body; the skin of the head with the ears and horns fastened on his own head in such a way as to deceive the buffaloe: thus dressed he fixes himself at a convenient distance between a herd of buffaloe and any of the river precipices, which sometimes extend for several miles. His companions in the meantime get in the rear and side of the herd, and at a given signal show themselves, and advance towards the buffaloe: they instantly take the alarm, and finding the hunters beside them, they run towards the disguised Indian or decoy, who leads them on at full speed towards the river, when suddenly securing himself in some crevice of the cliff which he had previously fixed on, the herd is left on the brink of the precipice: it is then in vain for the foremost to retreat or even to stop; they are pressed on by the hindmost rank, who seeing no danger but from the hunters, goad on those before them till the whole are precipitated and the shore is strewed with their dead bodies. Sometimes in this perilous seduction the Indian is himself either trodden under foot by the rapid movements of the buffaloe, or missing his footing in the cliff, is urged down the precipice by the falling herd. The Indians then select as much meat as they wish, and the rest is abandoned to the wolves, and creates a most dreadful stench. The

wolves who had been feasting on these carcases were very fat, and so gentle that one of them was killed with an esponton. Above this place we came to for dinner at the distance of seventeen miles, opposite to a bold running river of twenty yards wide, and falling in on the south. From the objects we had just passed we called this stream Slaughter river. Its low grounds are narrow, and contain scarcely any timber. Soon after landing it began to blow and rain, and as there was no prospect of getting wood for fuel farther on, we fixed our camp on the north, three quarters of a mile above Slaughter river. After the labours of the day we gave to each man a dram, and such was the effect of long abstinence from spirituous liquors, that from the small quantity of half a gill of rum, several of the men were considerably affected by it, and all very much exhilarated. Our game to day consisted of an elk and two beaver.

Thursday, 30. The rain which commenced last evening continued with little intermission till eleven this morning, when the high wind which accompanied it having abated, we set out. More rain has now fallen than we have had since the 1st of September last, and many circumstances indicate our approach to a climate differing considerably from that of the country through which we have been passing: the air of the open country is astonishingly dry and pure. Observing that the case of our sextant, though perfectly seasoned, shrank and the joints opened, we tried several experiments,

by which it appeared that a tablespoon full of water exposed in a saucer to the air, would evaporate in thirty-six hours, when the mercury did not stand higher than the temperate point at the greatest heat of the day. The river, notwithstanding the rain, is much clearer than it was a few days past; but we advance with great labour and difficulty; the rapid current, the ripples and rocky points rendering the navigation more embarrassing than even that of yesterday; in addition to which the banks are now so slippery after the rain, that the men who draw the canoes can scarcely walk, and the earth and stone constantly falling down the high bluffs make it dangerous to pass under them; still however we are obliged to make use of the cord, as the wind is strong a-head, the current too rapid for oars, and too deep for the pole. In this way we passed at the distance of five and a half miles a small rivulet in a bend on the north, two miles further an island on the same side, half a mile beyond which we came to a grove of trees at the entrance of a run in a bend to the south, and encamped for the night on the northern shore. The eight miles which we made to-day cost us much trouble. The air was cold and rendered more disagreeable by the rain, which fell in several slight showers in the course of the day; our cords too broke several times, but fortunately without injury to the boats. On ascending the hills near the river, one of the party found that there was snow mixed with the rain on the heights; a little back of these

the country becomes perfectly level on both sides of the river. There is now no timber on the hills, and only a few scattering cottonwood, ash, box-alder, and willows, along the water. In the course of the day we passed several encampments of Indians, the most recent of which seemed to have been evacuated about five weeks since, and from the several apparent dates, we supposed that they were made by a band of about one hundred lodges, who were travelling slowly up the river. Although no part of the Missouri from the Minnetarees to this place, exhibits signs of permanent settlements, yet none seems exempt from the transient visits of hunting parties. We know that the Minnetarees of the Missouri extend their excursions on the south side of the river, as high as the Yellowstone; and the Assiniboins visit the northern side, most probably as high as the Porcupine river. All the lodges between that place and the Rocky mountains, we supposed to belong to the Minnetarees of Fort de Prairie, who live on the south fork of the Saskashawan.

Friday, 31. We proceeded in two perioques, leaving the canoes to bring on the meat of two buffaloes killed last evening. Soon after we set off it began to rain, and though it ceased at noon, the weather continued cloudy during the rest of the day. The obstructions of yesterday still remain, and fatigue the men excessively: the banks are so slippery in some places, and the mud so adhesive, that they are unable to wear their moccasins: one-

fourth of the time they are obliged to be up to their armpits in the cold water, and sometimes walk for several yards over the sharp fragments of rocks which have fallen from the hills: all this, added to the burden of dragging the heavy canoes, is very painful, yet the men bear it with great patience and good humour. Once the rope of one of the perioques, the only one we had made of hemp, broke short, and the perioque swung and just touched a point of rock which almost upset her. At nine miles we came to a high wall of black rock, rising from the water's edge on the south, above the cliffs of the river: this continued about a quarter of a mile, and was succeeded by a high open plain, till three miles further a second wall, two hundred feet high, rose on the same side. Three miles further a wall of the same kind, about two hundred feet high and twelve in thickness, appeared to the north. These hills and river-cliffs exhibit a most extraordinary and romantic appearance: they rise in most places nearly perpendicular from the water, to the height of between two and three hundred feet, and are formed of very white sandstone, so soft as to yield readily to the impression of water: in the upper part of which lie imbedded two or three thin horizontal strata of white freestone insensible to the rain, and on the top is a dark rich loam, which forms a gradually ascending plain, from a mile to a mile and a half in extent, when the hills again rise abruptly to the height of about three hundred feet more. In trickling

down the cliffs, the water has worn the soft sandstone into a thousand grotesque figures, among which, with a little fancy, may be discerned elegant ranges of free stone buildings, with columns variously sculptured, and supporting long and elegant galleries, while the parapets are adorned with statuary: on a nearer approach they represent every form of elegant ruins; columns, some with pedestals and capitals entire, others mutilated and prostrate, some rising pyramidally over each other till they terminate in a sharp point. These are varied by niches, alcoves, and the customary appearances of desolated magnificence: the illusion is increased by the number of martins, who have built their globular nests in the niches, and hover over these columns; as in our country they are accustomed to frequent large stone structures. As we advance there seems no end to the visionary enchantment which surrounds us. In the midst of this fantastic scenery, are vast ranges of walls, which seem the productions of art, so regular is the workmanship: they rise perpendicularly from the river, sometimes to the height of one hundred feet, varying in thickness from one to twelve feet, being equally as broad at the top as below. The stones of which they are formed are black, thick, and durable, and composed of a large portion of earth, intermixed and cemented with a small quantity of sand, and a considerable proportion of talc or quartz. These stones are almost invariably regular parallelipeds of unequal sizes in the wall, but equally deep, and laid

regularly in ranges over each other like bricks, each breaking and covering the interstice of the two on which it rests; but though the perpendicular interstice be destroyed, the horizontal one extends entirely through the whole work: the stones too are proportioned to the thickness of the wall in which they are employed, being largest in the thickest walls. The thinner walls are composed of a single depth of the paralleliped, while the thicker ones consist of two or more depths: these walls pass the river at several places, rising from the water's edge much above the sandstone bluffs, which they seem to penetrate; thence they cross in a straight line on either side of the river, the plains over which they tower to the height of from ten to seventy feet, until they lose themselves in the second range of hills: sometimes they run parallel in several ranges near to each other, sometimes intersect each other at right angles, and have the appearance of ancient houses or gardens.

The face of some of these river hills, is composed of very excellent freestone of a light yellowish brown colour, and among the cliffs we found a species of pine which we had not yet seen, and differing from the Virginia pitchpine in having a shorter leaf, and a longer and more pointed cone. The coal appears only in small quantities, as do the burnt earth and pumicestone: the mineral salts have abated. Among the animals are a great number of the bighorn, a few buffaloe and elk, and some mule deer, but none of the common deer

nor any antelopes. We saw, but could not procure, a beautiful fox, of a colour varied with orange, yellow, white, and black, rather smaller than the common fox in this country, and about the same size as the red fox of the United States.

The river to-day has been from about one hundred and fifty to two hundred and fifty yards wide, with but little timber. At the distance of two miles and a half from the last stone wall, is a stream on the north side, twenty-eight yards in width, and with some running water. We encamped just above its mouth, having made eighteen miles.

Saturday, June 1. The weather was cloudy with a few drops of rain. As we proceeded by the aid of our cord, we found the river-cliffs and bluffs not so high as yesterday, and the country more level. The timber too is in greater abundance on the river, though there is no wood on the high ground; coal however appears in the bluffs. The river is from two hundred to two hundred and fifty feet wide, the current more gentle, the water becoming still clearer, and fewer rocky points and shoals than we met yesterday, though those which we did encounter were equally difficult to pass. Game is by no means in such plenty as below; all that we obtained were one bighorn, and a mule-deer, though we saw in the plains a quantity of buffaloe, particularly near a small lake about eight miles from the river to the south. Notwithstanding the wind was a-head all day, we dragged the canoes along the distance of twenty-three miles. At fourteen

and a quarter miles, we came to a small island opposite a bend of the river to the north: two and a half miles to the upper point of a small island on the north; five miles to another island on the south side, and opposite to a bluff. In the next two miles we passed an island on the south, a second beyond it on the north, and reached near a high bluff on the north a third, on which we encamped. In the plains near the river are the chokecherry, yellow and red currant bushes, as well as the wild rose and prickly pear, both of which are now in bloom. From the tops of the river-hills, which are lower than usual, we enjoyed a delightful view of the rich fertile plains on both sides, in many places extending from the river cliffs to a great distance back. In the plains we meet occasionally large banks of pure sand, which were driven apparently by the south-west winds, and there deposited. The plains are more fertile some distance from the river than near its banks, where the surface of the earth is very generally strewed with small pebbles, which appear to be smoothed and worn by the agitation of the waters with which they were no doubt once covered. A mountain or part of the North mountain, approaches the river within eight or ten miles, bearing north from our encampment of last evening; and this morning a range of high mountains, bearing S. W. from us, and apparently running to the westward, are seen at a great distance covered with snow. In the evening we had a little more rain.

Sunday, 2. The wind blew violently last night, and a slight shower of rain fell, but this morning was fair. We set out at an early hour, and although the wind was a-head, by means of the cord, went on much better than for the last two days, as the banks were well calculated for towing. The current of the river is strong but regular, its timber increases in quantity, the low grounds become more level and extensive, and the bluffs on the river are lower than usual. In the course of the day we had a small shower of rain, which lasted a few minutes only. As the game is very abundant, we think it necessary to begin a collection of hides, for the purpose of making a leathern boat, which we intend constructing shortly. The hunters, who were out the greater part of the day, brought in six elk, two buffaloe, two mule-deer, and a bear. This last animal had nearly cost us the lives of two of our hunters, who were together when he attacked them; one of them narrowly escaped being caught, and the other, after running a considerable distance, concealed himself in some thick bushes, and while the bear was in quick pursuit of his hiding place, his companion came up and fortunately shot the animal through the head.

At six and a half miles we reached an island on the northern side; one mile and a quarter thence is a timbered low ground on the south: and in the next two and three quarter miles we passed three small islands, and came to a dark bluff on the south: within the following mile are two small

islands on the same side. At three and a quarter miles we reached the lower part of a much larger island near a northern point, and as we coasted along its side, within two miles passed a smaller island, and half a mile above reached the head of another. All these islands are small, and most of them contain some timber. Three quarters of a mile beyond the last, and at the distance of eighteen miles from our encampment, we came to for the night in a handsome low cottonwood plain on the south, where we remained for the purpose of making some celestial observations during the night, and of examining in the morning a large river which comes in opposite to us. Accordingly at an early hour,

Monday, 3d, we crossed and fixed our camp in the point, formed by the junction of the river with the Missouri. It now became an interesting question which of these two streams is what the Minnetarees call Ahmateahza or the Missouri, which they describe as approaching very near to the Columbia. On our right decision much of the fate of the expedition depends; since, if after ascending to the rocky mountains or beyond them, we should find that the river we were following did not come near the Columbia, and be obliged to return, we should not only lose the travelling season, two months of which had already elapsed, but probably dishearten the men so much as to induce them either to abandon the enterprise, or yield us a cold obedience instead of the warm and zealous support which they had hitherto afforded

us. We determined, therefore, to examine well before we decided on our future course; and for this purpose dispatched two canoes with three men up each of the streams, with orders to ascertain the width, depth, and rapidity of the current, so as to judge of their comparative bodies of water. At the same time parties were sent out by land to penetrate the country, and discover from the rising grounds, if possible, the distant bearings of the two rivers; and all were directed to return towards evening. While they were gone we ascended together the high grounds in the fork of these two rivers, whence we had a very extensive prospect of the surrounding country: on every side it was spread into one vast plain covered with verdure, in which innumerable herds of buffaloe were roaming, attended by their enemies the wolves: some flocks of elk also were seen, and the solitary antelopes were scattered with their young over the face of the plain. To the south was a range of lofty mountains, which we supposed to be a continuation of the South mountain, stretching themselves from south-east to north-west, and terminating abruptly about south-west from us. These were partially covered with snow; but at a great distance behind them was a more lofty ridge completely covered with snow, which seemed to follow the same direction as the first, reaching from west to the north of north-west, where their snowy tops were blended with the horizon. The direction of the rivers could not however be long distinguished, as they were soon lost in the extent of the plain. On our

return we continued our examination; the width of the north branch is two hundred yards, that of the south is three hundred and seventy-two. The north, although narrower and with a gentler current, is deeper than the south: its waters too are of the same whitish brown colour, thickness, and turbidness: they run in the same boiling and rolling manner which has uniformly characterized the Missouri: and its bed is composed of some gravel, but principally mud. The south fork is deeper, but its waters are perfectly transparent: its current is rapid, but the surface smooth and unruffled; and its bed too is composed of round and flat smooth stones like those of rivers issuing from a mountainous country. The air and character of the north fork so much resemble those of the Missouri that almost all the party believe that to be the true course to be pursued. We, however, although we have given no decided opinion, are inclined to think otherwise, because, although this branch does give the colour and character to the Missouri, yet these very circumstances induce an opinion that it rises in, and runs through an open plain country, since if it came from the mountains it would be clearer, unless, which from the position of the country is improbable, it passed through a vast extent of low ground after leaving them: we thought it probable that it did not even penetrate the Rocky mountains, but drew its sources from the open country towards the lower and middle parts of the Saskashawan, in a direction

north of this place. What embarrasses us most is, that the Indians, who appeared to be well acquainted with the geography of this country, have not mentioned this northern river; "for the river which scolds at all others," as it is termed, must be, according to their account, one of the rivers which we have passed; and if this north fork be the Missouri, why have they not designated the south branch which they must also have passed, in order to reach the great falls which they mention on the Missouri. In the evening our parties returned, after ascending the river in canoes for some distance, then continuing on foot, just leaving themselves time to return by night. The north fork was less rapid, and therefore afforded the easiest navigation: the shallowest water of the north was five feet deep, that of the south six feet. At two and a half miles up the north fork is a small river coming in on the left or western side, sixty feet wide, with a bold current three feet in depth. The party by land had gone up the south fork, in a straight line, somewhat north of west for seven miles, where they discovered that this little river came within one hundred yards of the south fork, and on returning down it, found it a handsome stream, with as much timber as either of the larger rivers, consisting of the narrow and wide-leaved cottonwood, some birch and box-alder, and undergrowth of willows, rosebushes, and currants: they also saw on this river a great number of elk, and some beaver.

All these accounts were, however, very far from deciding the important question of our future route, and we therefore determined each of us to ascend one of the rivers during a day and a half's march, or farther if necessary, for our satisfaction. Our hunters killed two buffaloe, six elk, and four deer to-day. Along the plains near the junction, are to be found the prickly pear in great quantities; the choke-cherry is also very abundant in the river low grounds, as well as the ravines along the river bluffs; the yellow and red currants are not yet ripe; the gooseberry is beginning to ripen, and the wild rose, which now covers all the low grounds near the rivers, is in full bloom. The fatigues of the last few days have occasioned some falling off in the appearance of the men, who not having been able to wear moccasins, had their feet much bruised and mangled in passing over the stones and rough ground. They are however perfectly cheerful, and have an undiminished ardour for the expedition.

Tuesday, June 4. At the same hour this morning Captain Lewis and Captain Clarke set out to explore the two rivers; Captain Lewis with six men, crossed the north fork near the camp, below a small island, from which he took a course N. 30° W. for four and a half miles to a commanding eminence. Here we observed that the north mountain, changing its direction parallel to the Missouri, turned towards the north and terminated abruptly at the distance of about thirty miles, the point of termination bearing N. 48° E. The south moun-

tain too diverges to the south, and terminates abruptly, its extremity bearing S. 8° W. distant about twenty miles: to the right of, and retreating from this extremity, is a separate mountain at the distance of thirty-five miles, in a direction S. 38° W. which from its resemblance to the roof of a barn, we called the Barn mountain. The north fork, which is now on the left, makes a considerable bend to the north-west, and on its western border a range of hills about ten miles long, and bearing from this spot N. 60° W. runs parallel with it: north of this range of hills is an elevated point of the river bluff on its south side, bearing N. 72° W. about twelve miles from us; towards this he directed his course across a high, level, dry, open plain, which in fact embraces the whole country to the foot of the mountains. The soil is dark, rich, and fertile, yet the grass by no means so luxuriant as might have been expected, for it is short and scarcely more than sufficient to cover the ground. There are vast quantities of prickly pears, and myriads of grasshoppers, which afford food for a species of curlew which is in great numbers in the plain. He then proceeded up the river to the point of observation they had fixed on; from which he went two miles N. 15° W. to a bluff point on the north side of the river: thence his course was N. 30° W. for two miles to the entrance of a large creek on the south. The part of the river along which he passed is from forty to sixty yards wide, the current strong, the water deep and turbid, the

banks falling in, the salts, coal, and mineral appearances are as usual, and in every respect, except as to size, this river resembles the Missouri. The low grounds are narrow, but well supplied with wood; the bluffs are principally of dark brown yellow, and some white clay, with freestone in some places. From this point the river bore N. 20° E. to a bluff on the south, at the distance of twelve miles: towards this he directed his course, ascending the hills, which are about two hundred feet high, and passing through plains for three miles, till he found the dry ravines so steep and numerous that he resolved to return to the river and follow its banks. He reached it about four miles from the beginning of his course, and encamped on the north in a bend among some bushes which sheltered the party from the wind: the air was very cold, the north-west wind high, and the rain wetted them to the skin. Besides the game just mentioned, he observed buffaloe, elk, wolves, foxes, and got a blaireau and a weasel, and wounded a large brown bear, whom it was too late to pursue. Along the river are immense quantities of roses which are now in full bloom, and which make the low grounds a perfect garden.

Wednesday, 5. The rain fell during the greater part of the last night, and in the morning the weather was cloudy and cold, with a high north-west wind: at sun-rise he proceeded up the river eight miles, to the bluff on the left side, towards which he had been directing his course yesterday. Here he found the bed of a creek twenty-five yards

wide at the entrance, with some timber, but no water, notwithstanding the rain: it is, indeed, astonishing to observe the vast quantities of water absorbed by the soil of the plains, which being opened in large crevices, presents a fine rich loam. At the mouth of this stream (which he called Lark creek) the bluffs are very steep, and approach the river, so that he ascended them, and crossing the plains reached the river, which from the last point bore N. 50° W.: four miles from this place it extended north two miles. Here he discovered a lofty mountain standing alone at the distance of more than 80 miles in the direction of N. 30° W. and which, from its conical figure, he called Tower mountain. He then proceeded on these two hills, and afterwards in different courses six miles, when he again changed for a western course across a deep bend along the south side; in making this passage over the plains, he found them like those of yesterday, level and beautiful, with great quantities of buffaloe, and some wolves, foxes, and antelopes, and intersected near the river by deep ravines. Here, at the distance of from one to nine miles from the river, he met the largest village of barking squirrels which we had yet seen; for he passed a skirt of their territory for seven miles. He also saw near the hills a flock of the mountain-cock, or a large species of heath-hen, with a long pointed tail, which the Indians below had informed us were common among the Rock mountains. Having finished his course of ten miles west across

a bend, he continued two miles N. 80° W. and from that point discovered some lofty mountains to the north-west of Tower mountain, and bearing N. 65° W. at eighty or one hundred miles distance: here he encamped on the north side in a handsome low ground, on which were several old stick lodges: there had been but little timber on the river in the forepart of the day, but now there was a greater quantity than usual. The river itself is about eighty yards wide, from six to ten feet deep, and has a strong steady current. The party had killed five elk, and a mule-deer; and by way of experiment, roasted the burrowing-squirrels, which they found to be well-flavoured and tender.

Thursday, 6. Captain Lewis was now convinced that this river pursued a direction too far north for our route to the Pacific, and therefore resolved to return; but waited till noon to take a meridian altitude. The clouds, however, which had gathered during the latter part of the night continued and prevented the observation. Part of the men were sent forward to a commanding eminence, six miles S. 70° W.; from which they saw at the distance of about fifteen miles S. 80° W. a point of the south bluff of the river, which thence bore northwardly. In their absence two rafts had been prepared, and when they returned about noon, the party embarked: but they soon found that the rafts were so small and slender, that the baggage was wetted, and therefore it was necessary to abandon them, and go by land. They therefore crossed the

plains, and at the distance of twelve miles came to the river, through a cold storm from the north-east, accompanied by showers of rain. The abruptness of the cliffs compelled them, after going a few miles, to leave the river and meet the storm in the plains. Here they directed their course too far northward, in consequence of which they did not meet the river till late at night, after having travelled twenty-three miles since noon, and halted at a little below the entrance of Lark creek. They had the good fortune to kill two buffaloe, which supplied them with supper: but spent a very uncomfortable night, without any shelter from the rain, which continued till morning,

Friday, 7, when at an early hour they continued down the river. The route was extremely unpleasant, as the wind was high from the N. E. accompanied with rain, which made the ground so slippery that they were unable to walk over the bluffs which they had passed on ascending the river. The land is the most thirsty we have ever seen; notwithstanding all the rain which has fallen, the earth is not wet for more than two inches deep, and resembles thawed ground; but if it requires more water to saturate it than the common soils, on the other hand it yields moisture with equal difficulty. In passing along the side of one of these bluffs, at a narrow pass thirty yards in length, Captain Lewis slipped, and but for a fortunate recovery, by means of his espontoon, would have been precipitated into the river over a precipice

of about ninety feet. He had just reached a spot, where, by the assistance of his espontoon, he could stand with tolerable safety, when he heard a voice behind him cry out, "Good God! Captain, what shall I do?" He turned instantly, and found it was Windsor, who had lost his foothold about the middle of the narrow pass, and had slipped down to the very verge of the precipice, where he lay on his belly, with his right arm and leg over the precipice, while with the other leg and arm he was with difficulty holding on to keep himself from being dashed to pieces below. His dreadful situation was instantly perceived by Captain Lewis, who, stifling his alarm, calmly told him that he was in no danger; that he should take his knife out of his belt with the right hand, and dig a hole in the side of the bluff to receive his right foot. With great presence of mind he did this, and then raised himself on his knees; Captain Lewis then told him to take off his moccasins, and come forward on his hands and knees, holding the knife in one hand and his rifle in the other. He immediately crawled in this way till he came to a secure spot. The men who had not attempted this passage, were ordered to return and wade the river at the foot of the bluff, where they found the water breast high. This adventure taught them the danger of crossing the slippery heights of the river; but as the plains were intersected by deep ravines almost as difficult to pass, they continued down the river, sometimes in the mud of the low grounds, sometimes up to their

arms in the water, and when it became too deep to wade, they cut footholds with their knives in the sides of the banks. In this way they travelled through the rain, mud, and water, and having made only eighteen miles during the whole day, encamped in an old Indian lodge of sticks, which afforded them a dry shelter. Here they cooked part of six deer they had killed in the course of their walk, and having eaten the only morsel they had tasted during the whole day, slept comfortably on some willow boughs.

CHAPTER X.

RETURN OF CAPTAIN LEWIS — ACCOUNT OF CAPTAIN CLARKE'S RESEARCHES WITH HIS EXPLORING PARTY — PERILOUS SITUATION OF ONE OF HIS PARTY — TANSY RIVER DESCRIBED — THE PARTY STILL BELIEVING THE SOUTHERN FORK THE MISSOURI, CAPTAIN LEWIS RESOLVES TO ASCEND IT — MODE OF MAKING A PLACE TO DEPOSIT PROVISIONS, CALLED CACHE — CAPTAIN LEWIS EXPLORES THE SOUTHERN FORK — FALLS OF THE MISSOURI DISCOVERED, WHICH ASCERTAINS THE QUESTION — ROMANTIC SCENERY OF THE SURROUNDING COUNTRY — NARROW ESCAPE OF CAPTAIN LEWIS — THE MAIN BODY UNDER CAPTAIN CLARKE APPROACH WITHIN FIVE MILES OF THE FALLS, AND PREPARE FOR MAKING A PORTAGE OVER THE RAPIDS.

SATURDAY, 8. It continued to rain moderately all last night, and the morning was cloudy till about ten o'clock, when it cleared off, and became a fine day. They breakfasted about sun-rise, and then proceeded down the river in the same way as they had done yesterday, except that the travelling was somewhat better, as they had not so often to wade, though they passed some very dangerous bluffs. The only timber to be found is in the low grounds, which are occasionally on the river, and these are the haunts of innumerable

birds, who, when the sun began to shine, sang very delightfully. Among these birds they distinguished the brown thrush, robin, turtledove, linnet, goldfinch, the large and small blackbird, the wren, and some others. As they came along, the whole of the party were of opinion that this river was the true Missouri; but Captain Lewis being fully persuaded that it was neither the main stream, nor that which it would be adviseable to ascend, gave it the name of Maria's river. After travelling all day, they reached the camp at five o'clock in the afternoon, and found Captain Clarke and the party very anxious for their safety, as they had staid two days longer than had been expected, and as Captain Clarke had returned at the appointed time, it was feared that they had met with some accident.

Captain Clarke, on setting out with five men on the 4th, went seven miles on a course S. 25° W. to a spring; thence he went S. 20° W. for eight miles to the river where was an island, from which he proceeded in a course N. 45° W. and approached the river at the distance of three, five, and thirteen miles, at which place they encamped in an old Indian lodge made of sticks and bark. In crossing the plains they observed several herds of buffaloe, some mule-deer, antelopes, and wolves. The river is rapid, and closely hemmed in by high bluffs, crowded with bars of gravel, with little timber on the low grounds, and none on the highlands. Near the camp this evening, a white bear attacked one of the men, whose gun happening to be wet, would

not go off; he instantly made towards a tree, but was so closely pursued, that as he ascended the tree he struck the bear with his foot. The bear not being able to climb, waited till he should be forced to come down; and as the rest of the party were separated from him by a perpendicular cliff of rocks, which they could not descend, it was not in their power to give him any assistance: fortunately, however, at last the bear became frightened at their cries and firing, and released the man. In the afternoon it rained, and during the night there fell both rain and snow, and in the morning,

June 5, the hills to the S. E. were covered with snow, and the rain continued. They proceeded on in a course N. 20° W. near the river several miles, till at the distance of eleven miles they reached a ridge, from the top of which, on the north side, they could plainly discern a mountain to the S. and W. at a great distance, covered with snow; a high ridge projecting from the mountains to the south-east approaches the river on the south-east side, forming some cliffs of dark hard stone. They also saw that the river ran for a great distance west of south, with a rapid current, from which, as well as its continuing of the same width and depth, Captain Clarke thought it useless to advance any further, and therefore returned across the level plain in a direction north 30° east, and reached, at the distance of twenty miles, the little river which is already mentioned as falling into the north fork, and to which they gave the name of

Tansy river, from the great quantity of that herb growing on its banks. Here they dined, and then proceeded on a few miles by a place where the Tansy breaks through a high ridge on its north side, and encamped.

The next day, 6th, the weather was cold, raw, and cloudy, with a high north-east wind. They set out early down the Tansy, whose low grounds resemble precisely, except as to extent, those of the Missouri before it branches, containing a great proportion of a species of cotton-wood, with a leaf like that of the wild cherry. After halting at twelve o'clock for dinner, they ascended the plain, and at five o'clock reached the camp through the rain, which had fallen without intermission since noon. During his absence the party had been occupied in dressing skins, and being able to rest themselves, were nearly freed from their lameness and swollen feet. All this night, and the whole of the following day, 7th, it rained, the wind being from the south-west off the mountains: yet the rivers are falling, and the thermometer 40° above 0. The rain continued till the next day, 8th, at ten o'clock, when it cleared off, and the weather became fine, the wind high from the south-west. The rivers at the point have now fallen six inches since our arrival, and this morning the water of the south fork became of a reddish-brown colour, while the north branch continued of its usual whitish appearance. The mountains to the south are covered with snow.

Sunday, 9th. We now consulted upon the course to be pursued. On comparing our observations we were more than ever convinced of what we already suspected, that Mr. Arrowsmith is incorrect, in laying down in the chain of Rocky mountains one remarkable mountain called the Tooth, nearly as far south as 45° , and said to be so marked from the discoveries of a Mr. Fidler. We are now within one hundred miles of the Rocky mountains, and in the latitude of $47^{\circ} 24' 12'' 8$, and therefore it is highly improbable that the Missouri should make such a bend to the south before it reaches the Rocky mountains, as to have suffered Mr. Fidler to come as low as 45° along the eastern borders without touching that river: yet the general course of Maria's river from this place for fifty-nine miles, as far as Captain Lewis ascended, was north 69° west, and the south branch, or what we consider the Missouri, which Captain Clarke had examined as far as forty-five miles in a straight line, ran in a course south 29° west, and as far as it could be seen went considerably west of south, whence we conclude that the Missouri itself enters the Rocky mountains to the north of 45° . In writing to the President from our winter quarters, we had already taken the liberty of advancing the southern extremity of Mr. Fidler's discoveries about a degree to the northward, and this from Indian information, as to the bearing of the point at which the Missouri enters the mountain; but we think actual observation will place it one degree still further to the

northward. This information of Mr. Fidler however, incorrect as it is, affords an additional reason for not pursuing Maria's river; for if he came as low even as 47° , and saw only small streams coming down from the mountains, it is to be presumed that these rivulets do not penetrate the Rocky mountains, so far as to approach any navigable branch of the Columbia, and they are most probably the remote waters of some northern branch of the Missouri. In short, being already in latitude $47^{\circ} 24'$ we cannot reasonably hope, by going farther to the northward, to find between this place and the Saskahawan, any stream which can, as the Indians assure us the Missouri does, possess a navigable current for some distance in the Rocky mountains. The Indians had assured us also that the water of the Missouri was nearly transparent at the falls; this is the case with the southern branch; that the falls lay a little to the south of sun-set from them; this too is in favour of the southern fork, for it bears considerably south of this place, which is only a few minutes to the northward of Fort Mandan; that the falls are below the Rocky mountains, and near the northern termination of one range of those mountains: now there is a ridge of mountains which appears behind the South mountains, and terminates to the south-west of us, at a sufficient distance from the unbroken chain of the Rocky mountains, to allow space for several falls, indeed we fear for too many of them. If, too, the Indians had ever passed any stream as large as this southern

fork on their way up the Missouri, they would have mentioned it; so that their silence seems to prove that this branch must be the Missouri. The body of water also which it discharges must have been acquired from a considerable distance in the mountains, for it could not have been collected in the parched plains between the Yellowstone and the Rocky mountains, since that country could not supply nourishment for the dry channels which we passed on the south, and the travels of Mr. Fidler forbid us to believe that it could have been obtained from the mountains towards the north-west.

These observations, which satisfied our minds completely, we communicated to the party: but every one of them were of a contrary opinion; and much of their belief depended on Cruzatte, an experienced waterman on the Missouri, who gave it as his decided judgment, that the north fork was the genuine Missouri. The men therefore mentioned, that although they would most cheerfully follow us wherever we should direct, yet they were afraid that the south fork would soon terminate in the Rocky mountains, and leave us at a great distance from the Columbia. In order that nothing might be omitted which could prevent our falling into an error, it was agreed that one of us should ascend the southern branch by land, until we reached either the falls or the mountains. In the meantime, in order to lighten our burdens as much as possible, we determined to deposit here one of

the perioques, and all the heavy baggage which we could possibly spare, as well as some provision, salt, powder, and tools: this would at once lighten the other boats, and give them the crew which had been employed on board the perioque.

Monday, 10. The weather being fair and pleasant, we dried all our baggage and merchandize, and made our deposit. These holes, or *caches*, as they are called by the Missouri traders, are very common, particularly among those who deal with the Sioux, as the skins and merchandize will keep perfectly sound for years, and are protected from robbery: our cache is built in this manner. In the high plains on the north side of the Missouri, and forty yards from a steep bluff, we chose a dry situation, and then describing a small circle of about twenty inches diameter, removed the sod as gently and carefully as possible: the hole is then sunk perpendicularly for a foot deep, or more, if the ground be not firm. It is now worked gradually wider as they descend, till at length it becomes six or seven feet deep, shaped nearly like a kettle, or the lower part of a large still, with the bottom somewhat sunk at the centre. As the earth is dug it is handed up in a vessel, and carefully laid on a skin or cloth, in which it is carried away, and usually thrown into the river, or concealed so as to leave no trace of it. A floor of three or four inches in thickness is then made of dry sticks, on which is thrown hay or a hide perfectly dry. The goods being well aired and dried are laid on this floor,

and prevented from touching the wall by other dried sticks, in proportion as the merchandize is stowed away: when the hole is nearly full, a skin is laid over the goods, and on this earth is thrown, and beaten down, until, with the addition of the sod first removed, the whole is on a level with the ground, and there remains not the slightest appearance of an excavation. In addition to this, we made another of smaller dimensions, in which we placed all the baggage, some powder, and our blacksmith's tools, having previously repaired such of the tools we carry with us as require mending. To guard against accident, we hid two parcels of lead and powder in two distinct places. The red perioque was drawn up on the middle of a small island at the entrance of Maria's river, and secured, by being fastened to the trees, from the effect of any floods. In the evening there was a high wind from the south-west, accompanied with thunder and rain. We now made another observation of the meridian altitude of the sun, and found that the mean latitude of the entrance of Maria's river, as deduced from three observations, is $47^{\circ} 25' 17'' 2$ north. We saw a small bird like the blue thrush or catbird, which we had not before met, and also observed that the beemartin, or kingbird, is common to this country, although there are no bees here, and in fact we have not met with the honey-bee since leaving the Osage river.

Tuesday, 11. This morning Captain Lewis with four men set out on their expedition up the south

branch. They soon reached the point where the Tansy river approaches the Missouri, and observing a large herd of elk before them, descended and killed several, which they hung up along the river, so that the party in the boats might see them as they came along. They then halted for dinner; but Captain Lewis, who had been for some days afflicted with the dysentery, was now attacked with violent pains attended by a high fever, and was unable to go on. He therefore encamped for the night under some willow boughs: having brought no medicine he determined to try an experiment with the small twigs of the chokeberry, which being stripped of their leaves, and cut into pieces about two inches long, were boiled in pure water, till they produced a strong black decoction of an astringent bitter taste; a pint of this he took at sun-set, and repeated the dose an hour afterwards. By ten o'clock he was perfectly relieved from pain, a gentle perspiration ensued, his fever abated, and in the morning he was quite recovered. One of the men caught several dozen fish of two species; the first is about nine inches long, of a white colour, round in shape; the mouth is beset, both above and below, with a rim of fine sharp teeth, the eye moderately large, the pupil dark, and the iris narrow, and of a yellowish-brown colour: in form and size it resembles the white chub of the Potomac, though its head is proportionably smaller; they readily bite at meat or grass-hoppers; but the flesh, though soft and of a fine white colour, is not highly flavoured. The

second species is precisely of the form and about the size of the fish known by the name of the hickory shad, or old wife, though it differs from it in having the outer edge of both the upper and lower jaw set with a rim of teeth, and the tongue and palate also are defended by long sharp teeth bending inwards, the eye is very large, the iris wide and of a silvery colour; they do not inhabit muddy water, and the flavour is much superior to that of the former species. Of the first kind we had seen a few before we reached Maria's river; but had found none of the last before we caught them in the Missouri above its junction with that river. The white cat continues as high as Maria's river, but they are scarce in this part of the river, nor have we caught any of them since leaving the Mandans which weighed more than six pounds.

Of other game they saw a great abundance even in their short march of nine miles.

Wednesday, 12. This morning Captain Lewis left the bank of the river in order to avoid the steep ravines which generally run from the shore to the distance of one or two miles in the plain: having reached the open country he went for twelve miles in a course a little to the west of south-west, when the sun becoming warm by nine o'clock, he returned to the river in quest of water and to kill something for breakfast, there being no water in the plain, and the buffaloe discovering them before they came within gunshot took flight. They reached the

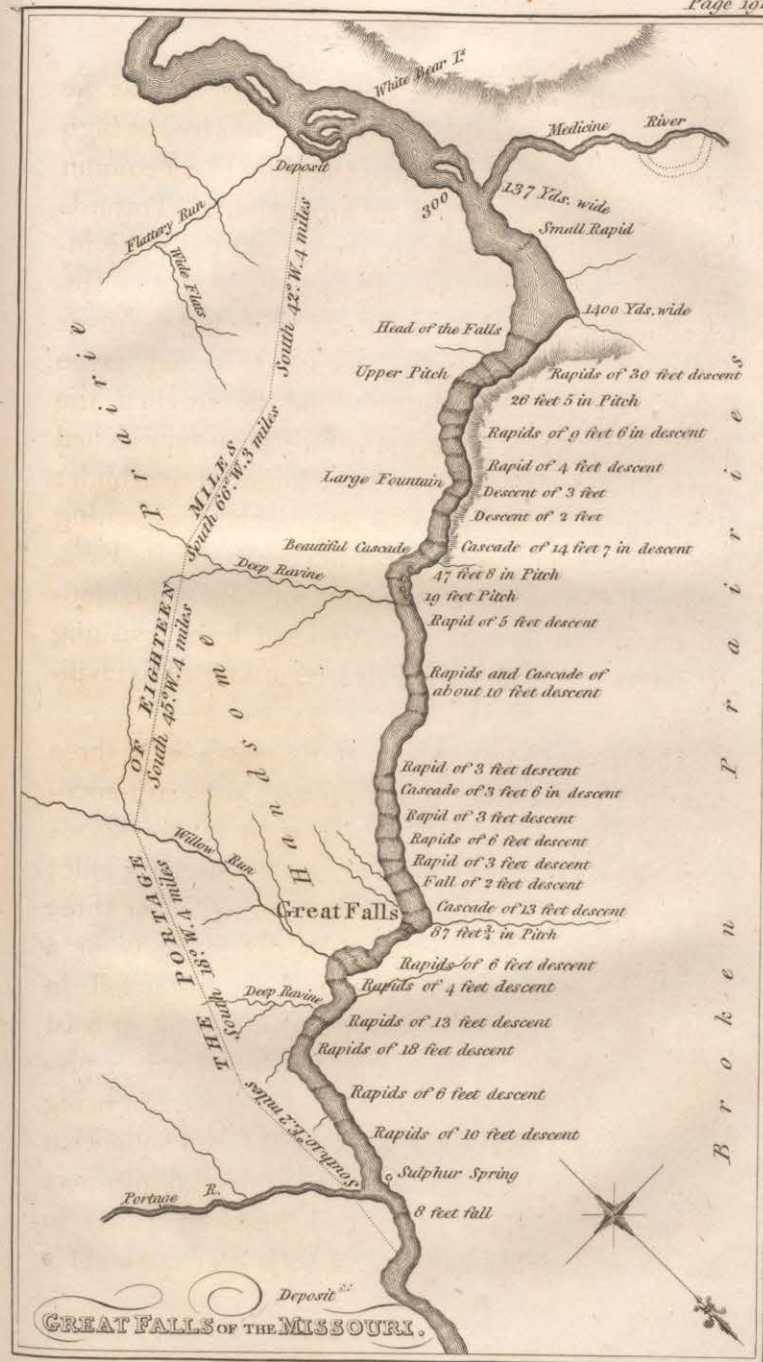

banks in a handsome open low ground with cotton-wood, after three miles walk. Here they saw two large brown bears, and killed them both at the first fire, a circumstance which has never before occurred since we have seen that animal. Having made a meal of a part and hung the remainder on a tree with a note for Captain Clarke, they again ascended the bluffs into the open plains. Here they saw great numbers of the burrowing squirrel, also some wolves, antelopes, mule-deer, and vast herds of buffalo. They soon crossed a ridge considerably higher than the surrounding plains, and from its top had a beautiful view of the Rocky mountains, which are now completely covered with snow: their general course is from south-east to the north of north-west, and they seem to consist of several ranges which successively rise above each other till the most distant mingles with the clouds. After travelling twelve miles they again met the river, where there was a handsome plain of cotton-wood; and although it was not sun-set, and they had only come twenty-seven miles, yet Captain Lewis felt weak from his late disorder, and therefore determined to go no further that night. In the course of the day they killed a quantity of game, and saw some signs of otter as well as beaver, and many tracks of the brown bear: they also caught great quantities of the white fish mentioned yesterday. With the broad-leaved cotton-wood, which has formed the principal timber of the Missouri, is here mixed another species, differing from the first only in the narrowness

of its leaf and the greater thickness of its bark. The leaf is long, oval, acutely pointed, about two and a half or three inches long, and from three quarters of an inch to an inch in width; it is smooth and thick, sometimes slightly grooved or channelled, with the margin a little serrate, the upper disk of a common, the lower of a whitish green. This species seems to be preferred by the beaver to the broad-leaved, probably because the former affords a deeper and softer bark.

Thursday, 13. They left their encampment at sun-rise, and ascending the river hills, went for six miles in a course generally south-west, over a country which though more waving than that of yesterday, may still be considered level. At the extremity of this course they overlooked a most beautiful plain, where were infinitely more buffalo than we had ever before seen at a single view. To the south-west arose from the plain two mountains of a singular appearance, and more like ramparts of high fortifications than works of nature. They are square figures with sides rising perpendicularly to the height of two hundred and fifty feet, formed of yellow clay, and the tops seemed to be level plains. Finding that the river here bore considerably to the south, and fearful of passing the Falls before reaching the Rocky mountains, they now changed their course to the south, and leaving those insulated hills to the right, proceeded across the plain. In this direction Captain Lewis had gone about two miles, when his ears were saluted with

the agreeable sound of a fall of water, and as he advanced, a spray which seemed driven by the high south-west wind arose above the plain like a column of smoke and vanished in an instant. Towards this point he directed his steps, and the noise increasing as he approached, soon became too tremendous to be mistaken for any thing but the great Falls of the Missouri. Having travelled seven miles after first hearing the sound, he reached the Falls about twelve o'clock, the hills as he approached were difficult of access, and two hundred feet high: down these he hurried with impatience, and seating himself on some rocks under the centre of the Falls, enjoyed the sublime spectacle of this stupendous object, which since the creation had been lavishing its magnificence upon the desert, unknown to civilization.

The river immediately at its cascade is three hundred yards wide, and is pressed in by a perpendicular cliff on the left, which rises to about one hundred feet, and extends up the stream for a mile; on the right the bluff is also perpendicular for three hundred yards above the Falls. For ninety or a hundred yards from the left cliff, the water falls in one smooth even sheet, over a precipice of at least eighty feet. The remaining part of the river precipitates itself with a more rapid current, but being received as it falls by the irregular and somewhat projecting rocks below, forms a splendid prospect of perfectly white foam two hundred yards in length, and eighty in perpendicular elevation. This

spray is dissipated into a thousand shapes, sometimes flying up in columns of fifteen or twenty feet, which are then oppressed by larger masses of the white foam, on all which the sun impresses the brightest colours of the rainbow. As it rises from the fall it beats with fury against a ledge of rocks which extends across the river at one hundred and fifty yards from the precipice. From the perpendicular cliff on the north, to the distance of one hundred and twenty yards, the rocks rise only a few feet above the water, and when the river is high, the stream finds a channel across them forty yards wide, and near the higher parts of the ledge which then rises about twenty feet, and terminate abruptly within eighty or ninety yards of the southern side. Between them and the perpendicular cliff on the south, the whole body of water runs with great swiftness. A few small cedars grow near this ridge of rocks which serves as a barrier to defend a small plain of about three acres shaded with cotton-wood, at the lower extremity of which is a grove of the same tree, where are several Indian cabins of sticks; below the point of them the river is divided by a large rock, several feet above the surface of the water, and extending down the stream for twenty yards. At the distance of three hundred yards from the same ridge is a second abutment of solid perpendicular rock about sixty feet high, projecting at right angles from the small plain on the north for one hundred and thirty-four yards into the river. After leaving this,

the Missouri again spreads itself to its usual width of three hundred yards, though with more than its ordinary rapidity.

The hunters who had been sent out, now returned loaded with buffalo meat, and Captain Lewis encamped for the night under a tree near the falls. The men were again dispatched to hunt for food against the arrival of the party, and Captain Lewis walked down the river to discover if possible some place where the canoes might be safely drawn on shore, in order to be transported beyond the Falls. He returned however without discovering any such spot, the river for three miles below being one continued succession of rapids and cascades, overhung with perpendicular bluffs from one hundred and fifty to two hundred feet high; in short, it seems to have worn itself a channel through the solid rock. In the afternoon they caught in the Falls some of both kinds of the white fish, and half a dozen trout from sixteen to twenty-three inches long, precisely resembling in form and the position of its fins, the mountain or speckled trout of the United States, except that the specks of the former are of a deep black, while those of the latter are of a red or gold colour: they have long sharp teeth on the palate and tongue, and generally a small speck of red on each side behind the front ventral fins; the flesh is of a pale yellowish red, or when in good order of a rose-coloured red.

Friday 14. This morning one of the men was sent to Captain Clarke with an account of the dis-

covery of the Falls, and after employing the rest in preserving the meat which had been killed yesterday, Captain Lewis proceeded to examine the rapids above. From the Falls he directed his course south-west up the river: after passing one continued rapid, and three small cascades, each three or four feet high, he reached, at the distance of five miles, a second fall. The river is about four hundred yards wide, and for the distance of three hundred throws itself over to the depth of nineteen feet, and so irregularly that he gave it the name of the Crooked Falls. From the southern shore it extends obliquely upwards about one hundred and fifty yards, and then forms an acute angle downwards nearly to the commencement of four small islands close to the northern side. From the perpendicular pitch to these islands, a distance of more than one hundred yards, the water glides down a sloping rock with a velocity almost equal to that of its fall. Above this Fall the river bends suddenly to the northward: while viewing this place Captain Lewis heard a loud roar above him, and crossing the point of a hill for a few hundred yards, he saw one of the most beautiful objects of nature: the whole Missouri is suddenly stopped by one shelving rock, which, without a single niche, and with an edge as straight and regular as if formed by art, stretches itself from one side of the river to the other for at least a quarter of a mile. Over this it precipitates itself in an even uninterrupted sheet to the perpendicular depth of fifty feet, whence dash-

ing against the rocky bottom it rushes rapidly down, leaving behind it a spray of the purest foam across the river. The scene which it presented was indeed singularly beautiful, since without any of the wild irregular sublimity of the lower falls, it combined all the regular elegances which the fancy of a painter would select to form a beautiful waterfall. The eye had scarcely been regaled with this charming prospect, when at the distance of half a mile Captain Lewis observed another of a similar kind: to this he immediately hastened, and found a cascade stretching across the whole river for a quarter of a mile with a descent of fourteen feet, though the perpendicular pitch was only six feet. This too in any other neighbourhood would have been an object of great magnificence, but after what he had just seen it became of secondary interest: his curiosity being however awakened, he determined to go on, even should night overtake him, to the head of the Falls. He therefore pursued the south-west course of the river, which was one constant succession of rapids and small cascades, at every one of which the bluffs grew lower, or the bed of the river became more on a level with the plains. At the distance of two and a half miles he arrived at another cataract of twenty-six feet. The river is here six hundred yards wide, but the descent is not immediately perpendicular, though the river falls generally with a regular and smooth sheet; for about one-third of the

descent a rock protrudes to a small distance, receives the water in its passage and gives it a curve. On the south side is a beautiful plain a few feet above the level of the Falls; on the north the country is more broken, and there is a hill not far from the river. Just below the Falls is a little island in the middle of the river well covered with timber. Here on a cotton-wood tree an eagle had fixed its nest, and seemed the undisputed mistress of a spot, to contest whose dominion neither man nor beast would venture across the gulfs that surround it, and which is further secured by the mist rising from the Falls. This solitary bird could not escape the observation of the Indians, who made the eagle's nest a part of their description of the Falls, which now proves to be correct in almost every particular, except that they did not do justice to their height. Just above this is a cascade of about five feet, beyond which, as far as could be discerned, the velocity of the water seemed to abate. Captain Lewis now ascended the hill which was behind him, and saw from its top a delightful plain extending from the river to the base of the Snow mountains to the south and south-west. Along this wide level country the Missouri pursued its winding course, filled with water to its even and grassy banks, while about four miles above it was joined by a large river flowing from the north-west through a valley three miles in width, and distinguished by the timber which adorned its shores; the Missouri

itself stretches to the south in one unruffled stream of water as if unconscious of the roughness it must soon encounter, and bearing on its bosom vast flocks of geese, while numerous herds of buffaloe are feeding on the plains which surround it.

Captain Lewis then descended the hills, and directed his course towards the river falling in from the west. He soon met a herd of at least a thousand buffaloe, and being desirous of providing for supper shot one of them; the animal immediately began to bleed, and Captain Lewis, who had forgotten to reload his rifle, was intently watching to see him fall, when he beheld a large brown bear who was stealing on him unperceived, and was already within twenty steps. In the first moment of surprise he lifted his rifle, but remembering instantly that it was not charged, and that he had not time to reload, he felt that there was no safety but in flight. It was in the open level plain, not a bush nor a tree within three hundred yards, the bank of the river sloping and not more than three feet high, so that there was no possible mode of concealment; Captain Lewis therefore thought of retreating in a quick walk, as fast as the bear advanced, towards the nearest tree; but as soon as he turned the bear ran open mouth and at full speed upon him. Captain Lewis ran about eighty yards, but finding that the animal gained on him fast, it flashed on his mind that by getting into the water to such a depth that the bear would be obliged to attack him swimming, there was still

some chance of his life; he therefore turned short, plunged into the river about waist deep, and facing about presented the point of his espartoon. The bear arrived at the water's edge within twenty feet of him, but as soon as he put himself in this posture of defence, he seemed frightened, and wheeling about, retreated with as much precipitation as he had pursued. Very glad to be released from this danger, Captain Lewis returned to the shore, and observed him run with great speed, sometimes looking back as if he expected to be pursued, till he reached the woods. He could not conceive the cause of the sudden alarm of the bear, but congratulating himself on his escape when he saw his own track torn to pieces by the furious animal, and learnt from the whole adventure never to suffer his rifle to be a moment unloaded. He now resumed his progress in the direction which the bear had taken towards the western river, and found it a handsome stream about two hundred yards wide, apparently deep, with a gentle current; its waters clear, and its banks, which were formed principally of dark brown and blue clay, are about the same height as those of the Missouri, that is from three to five feet. What was singular was that the river does not seem to overflow its banks at any season, while it might be presumed from its vicinity to the mountains, that the torrents arising from the melting of the snows, would sometimes cause it to swell beyond its limits. The contrary fact would induce a belief that the Rocky moun-

tains yield their snows very reluctantly and equably to the sun, and are not often drenched by very heavy rains. This river is no doubt that which the Indians call Medicine river, which they mentioned as emptying into the Missouri, just above the Falls. After examining Medicine river, Captain Lewis set out at half after six o'clock in the evening on his return towards the camp, which he estimated at the distance of twelve miles. In going through the low grounds on Medicine river, he met an animal which at a distance he thought was a wolf, but on coming within sixty paces, it proved to be some brownish-yellow animal standing near its burrow, which, when he came nigh, crouched and seemed as if about to spring on him. Captain Lewis fired, and the beast disappeared in its burrow. From the track and the general appearance of the animal, he supposed it to be of the tiger kind. He then went on, but as if the beasts of the forests had conspired against him, three buffaloe bulls which were feeding with a large herd at the distance of half a mile, left their companions and ran at full speed towards him. He turned round, and unwilling to give up the field, advanced towards them: when they came within a hundred yards, they stopped, looked at him for some time, and then retreated as they came. He now pursued his route in the dark, reflecting on the strange adventures and sights of the day, which crowded on his mind so rapidly, that he should have been inclined to believe it all enchant-

ment if the thorns of the prickly pear piercing his feet, did not dispel at every moment the illusion. He at last reached the party, who had been very anxious for his safety, and who had already decided on the route which each should take in the morning to look for him. Being much fatigued he supped and slept well during the night.

Saturday, 15. The men were again sent out to bring in the game killed yesterday, and to procure more: they also obtained a number of fine trout, and several small catfish weighing about four pounds, and differing from the white catfish lower down the Missouri. On awaking this morning Captain Lewis found a large rattlesnake coiled on the trunk of a tree under which he had been sleeping. He killed it, and found it like those we had seen before, differing from those of the Atlantic states, not in its colours, but in the form and arrangement of them; it had one hundred and seventy-six scuta on the abdomen, and seventeen half-formed scuta on the tail. There was a heavy dew on the grass about the camp every morning, which no doubt proceeds from the mist of the Falls, as it takes place no-where in the plains nor on the river except here. The messenger sent to Captain Clarke, returned with information of his having arrived five miles below at a rapid, which he did not think it prudent to ascend, and would wait till Captain Lewis and his party rejoined him.

On Tuesday, 11th, the day when Captain Lewis

left us, we remained at the entrance of Maria's river, and completed the deposits of all the articles with which we could dispense. The morning had been fair with a high wind from the south-west, which shifted in the evening to north-west, when the weather became cold and the wind high. The next morning,

Wednesday, 12, we left our encampment with a fair-day, and a south-west wind. The river was now so crowded with islands, that within the distance of ten miles and a half, we passed eleven of different dimensions before reaching a high black bluff in a bend on the left, where we saw a great number of swallows. Within one mile and a half further, we passed four small islands, two on each side, and at fifteen miles from our encampment, reached a spring which the men called Grog spring: it is on the northern shore, and at the point where Tansy river approaches within one hundred yards of the Missouri. From this place we proceeded three miles to a low bluff on the north opposite to an island, and spent the night in an old Indian encampment. The bluffs under which we passed, were composed of a blackish clay and coal for about eighty feet, above which, for thirty or forty feet, is a brownish yellow earth. The river is very rapid, and obstructed by bars of gravel and stone of different shapes and sizes, so that three of our canoes were in great danger in the course of the day. We had a few drops of

rain about two o'clock in the afternoon. The only animals we killed were elk and deer; but we saw great numbers of rattlesnakes.

Thursday, 13. The morning was fair, and there was some dew on the ground. After passing two islands, we reached at the distance of a mile and a half, a small rapid stream fifty yards wide, emptying itself on the south, rising in a mountain to the south-east, about twelve or fifteen miles distant, and at this time covered with snow. As it is the channel for the melted snow of that mountain, we called it Snow river: opposite to its entrance is another island: at one mile and three-quarters is a black bluff of slate on the south; nine miles beyond which, after passing ten islands, we came to on the southern shore near an old Indian fortified camp, opposite the lower point of an island, having made thirteen miles. The number of islands and shoals, the rapidity of the river, and the quantity of large stones, rendered the navigation very disagreeable: along the banks we distinguish several low bluffs or cliffs of slate. There were great numbers of geese and goslings; the geese not being able to fly at this season. Gooseberries are ripe and in great abundance; the yellow currant is also common, but not yet ripe. Our game consisted of buffaloe and goats.

Friday, 14. Again the day is fine. We made two miles to a small island in the southern bend, after passing several bad rapids. The current becomes indeed swifter as we ascend, and the canoes

frequently receive water as we drag them with difficulty along. At the distance of six miles we reached Captain Clarke's camp on the fourth, which is on the north side and opposite to a large gravelly bar. Here the man sent by Captain Lewis joined us with the pleasing intelligence that he had discovered the Falls, and was convinced that the course we were pursuing was that of the true Missouri. At a mile and a half we reached the upper point of an island, three-quarters of a mile beyond which we encamped on the south, after making only ten and a quarter miles. Along the river was but little timber, but much hard slate in the bluffs.

Saturday, 15. The morning being warm and fair we set out at the usual hour, but proceeded with great difficulty in consequence of the increased rapidity of the current. The channel is constantly obstructed by rocks and dangerous rapids. During the whole progress the men are in the water hauling the canoes, and walking on sharp rocks and round stones which cut their feet or cause them to fall. The rattlesnakes too are so numerous that the men are constantly on their guard against being bitten by them; yet they bear the fatigues with the most undiminished cheerfulness. We hear the roar of the Falls very distinctly this morning. At three and three quarter miles we came to a rock in a bend to the south, resembling a tower. At six and three-quarter miles we reached a large creek on the south, which after

one of our men we called Shields's creek. It is rapid in its course, about thirty yards wide, and on sending a person five miles up it proved to have a fall of fifteen feet, and some timber on its low ground. Above this river the bluffs of the Missouri are of red earth mixed with strata of black stone; below it we passed some white clay in the banks which mixes with water in every respect like flour. At three and three quarter miles we reached a point on the north opposite an island and a bluff; and one mile and a quarter further, after passing some red bluffs, came to on the north side, having made twelve miles. Here we found a rapid so difficult that we did not think proper to attempt the passage this evening, and therefore sent to Captain Lewis to apprise him of our arrival. We saw a number of geese, ducks, crows, and blackbirds to-day, the two former with their young. The river rose a little this evening, but the timber is still so scarce that we could not procure enough for our use during the night.

Sunday, June 16. Some rain fell last night, and this morning the weather was cloudy and the wind high from the south-west. We passed the rapid by doubly manning the perioque and canoes, and halted at the distance of a mile and a quarter, to examine the rapids above, which we found to be a continued succession of cascades as far as the view extended, which was about two miles. About a mile above where we halted was a large creek falling in on the south, opposite to which is a large

sulphur spring falling over the rocks on the north: Captain Lewis arrived at two from the Falls, about five miles above us, and after consulting upon the subject of the portage, we crossed the river and formed a camp on the north, having come three quarters of a mile to day. From our own observation we had deemed the south side to be the most favourable for a portage, but two men sent out for the purpose of examining it, reported that the creek and the ravines intersected the plain so deeply that it was impossible to cross it. Captain Clarke therefore resolved to examine more minutely what was the best route: the four canoes were unloaded at the camp, and then sent across the river, where by means of strong cords they were hauled over the first rapid, whence they may be easily drawn into the creek. Finding too, that the portage would be at all events too long to enable us to carry the boats on our shoulders, six men were set to work to make wheels for carriages to transport them. Since leaving Maria's river the wife of Chaboneau, our interpreter, has been dangerously ill, but she now found great relief from the mineral water of the sulphur spring. It is situated about two hundred yards from the Missouri, into which it empties over a precipice of rock, about twenty-five feet high. The water is perfectly transparent, strongly impregnated with sulphur, and we suspect iron also, as the colour of the hills and bluffs in the neighbourhood indicates the presence of that metal. In short the water, to

all appearance, is precisely similar to that of Bowyer's sulphur spring in Virginia.

Monday, 17. Captain Clarke set out with five men to explore the country; the rest were employed in hunting, making wheels, and in drawing the five canoes, and all the baggage up the creek, which we now called Portage creek: from this creek there is a gradual ascent to the top of the high plain, while the bluffs of the creek lower down and of the Missouri, both above and below its entrance, were so steep as to have rendered it almost impracticable to drag them up from the Missouri. We found great difficulty and some danger in even ascending the creek thus far, in consequence of the rapids and rocks of the channel of the creek, which just above where we brought the canoes has a fall of five feet, and high and steep bluffs beyond it: we were very fortunate in finding just below Portage creek, a cotton-wood tree about twenty-two inches in diameter, and large enough to make the carriage-wheels: it was perhaps the only one of the same size within twenty miles; and the cotton-wood, which we are obliged to employ in the other parts of the work, is extremely soft and brittle. The mast of the white perioque, which we mean to leave behind, supplied us with two axletrees. There are vast quantities of buffaloe feeding in the plains or watering in the river, which is also strewn with the floating carcasses and limbs of these animals. They go in large herds to water about the Falls, and as

all the passages to the river near that place are narrow and steep, the foremost are pressed into the river by the impatience of those behind. In this way we have seen ten or a dozen disappear over the Falls in a few minutes. They afford excellent food for the wolves, bears, and birds of prey; and this circumstance may account for the reluctance of the bears to yield their dominion over the neighbourhood.

Tuesday, 18. The perioque was drawn up a little below our camp, and secured in a thick copse of willow bushes. We now began to form a cache or place of deposit, and to dry our goods and other articles which required inspection. The waggonstoo are completed. Our hunters brought us ten deer, and we shot two out of a herd of buffaloe that came to water at the sulphur spring. There is a species of gooseberry growing abundantly among the rocks on the sides of the cliffs: it is now ripe, of a pale red colour, about the size of the common gooseberry, and like it is an ovate pericarp of soft pulp, enveloping a number of small whitish-coloured seeds, and consisting of a yellowish slimy mucilaginous substance, with a sweet taste; the surface of the berry is covered with a glutinous adhesive matter, and its fruit, though ripe, retains its withered corolla. The shrub itself seldom rises more than two feet high, is much branched, and has no thorns. The leaves resemble those of the common gooseberry, except in being smaller, and the berry is supported by separate peduncles, or footstalks,

half an inch long. There are also immense quantities of grasshoppers of a brown colour in the plains, and they no doubt contribute to the lowness of the grass, which is not generally more than three inches high, though it is soft, narrow-leafed, and affords a fine pasture for the buffaloe.

Wednesday, 19. The wind blew violently today, as it did yesterday, and as it does frequently in this open country, where there is not a tree to break or oppose its force. Some men were sent for the meat killed yesterday, which fortunately had not been discovered by the wolves. Another party went to Medicine river in quest of elk, which we hope may be induced to resort there, from there being more wood in that neighbourhood than on the Missouri. All the rest were occupied in packing the baggage and mending their moccasins, in order to prepare for the portage. We caught a number of the white fish, but no catfish or trout. Our poor Indian woman, who had recovered so far as to walk out, imprudently ate a quantity of the white apple, which with some dried fish, occasioned a return of her fever.

The meridian altitude of the sun's lower limb, as observed with octant by back observation, was $53^{\circ} 15'$, giving as the latitude of our camp $47^{\circ} 8' 59'' 5'''$.

Thursday, 20. As we were desirous of getting meat enough to last us during the portage, so that the men might not be diverted from their labour to look for food, we sent out four hunters to-day:

they killed eleven buffaloe. This was indeed an easy labour, for there are vast herds coming constantly to the opposite bank of the river to water; they seem also to make much use of the mineral water of the sulphur spring, but whether from choice, or because it is more convenient than the river, we cannot determine, as they sometimes pass near the spring and go on to the river. Besides this spring, brackish water, or that of a dark colour impregnated with mineral salts, such as we have frequently met on the Missouri, may be found in small quantities in some of the steep ravines on the north side of the river, opposite to us and the Falls.

Captain Clarke returned this evening, having examined the whole course of the river, and fixed the route most practicable for the portage. The first day, 17th, he was occupied in measuring the heights and distances along the banks of the river, and slept near a ravine at the foot of the crooked falls, having very narrowly escaped falling into the river, where he would have perished inevitably, in descending the cliffs near the grand cataract. The next day, 18th, he continued the same occupation, and arrived in the afternoon at the junction of Medicine and Missouri rivers; up the latter he ascended and passed, at the distance of a mile, an island and a little timber, in an easterly bend of the river. One mile beyond this he came to the lower point of a large island; another small island in the middle of the river, and one near the left shore, at the distance of three miles, opposite to the head of

which he encamped, near the mouth of a creek which appeared to rise in the South mountain. These three islands are opposite to each other, and we gave them the name of the Whitebear islands, from observing some of those animals on them. He killed a beaver, an elk, and eight buffaloe. One of the men who was sent a short distance from the camp, to bring home some meat, was attacked by a white bear, and closely pursued within forty paces of the camp, and narrowly escaped being caught. Captain Clarke immediately went with three men in quest of the bear, which he was afraid might surprise another of the hunters, who was out collecting the game. The bear was however too quick, for before Captain Clarke could reach the man, the bear had attacked him and compelled him to take refuge in the water. He now ran off as they approached, and it being late they deferred pursuing him till the next morning.

CHAPTER XI.

DESCRIPTION AND ROMANTIC APPEARANCE OF THE MISSOURI
AT THE JUNCTION OF THE MEDICINE RIVER — THE DIFFI-
CULTY OF TRANSPORTING THE BAGGAGE AT THE FALLS —
THE PARTY EMPLOYED IN THE CONSTRUCTION OF A BOAT
OF SKINS — THE EMBARRASMENTS THEY HAD TO EN-
COUNTER FOR WANT OF PROPER MATERIALS — DURING
THE WORK THE PARTY MUCH TROUBLED BY WHITE BEARS
— VIOLENT HAIL STORM, AND PROVIDENTIAL ESCAPE OF
CAPTAIN CLARKE AND HIS PARTY — DESCRIPTION OF A
REMARKABLE FOUNTAIN — SINGULAR EXPLOSION HEARD
FROM THE BLACK MOUNTAINS — THE BOAT FOUND TO BE
INSUFFICIENT, AND THE SERIOUS DISAPPOINTMENT OF
THE PARTY — CAPTAIN CLARKE UNDERTAKES TO REPAIR
THE DAMAGE BY BUILDING CANOES, AND ACCOMPLISHES
THE TASK.

ON the 19th Captain Clarke not being able to find the bear mentioned in the last chapter, spent the day in examining the country, both above and below the Whitebear islands, and concluded that the place of his encampment would be the best point for the extremity of the portage. The men were therefore occupied in drying the meat to be left here. Immense numbers of buffaloe are every where found, and they saw a summer duck which is now sitting.

The next morning, 20th, he crossed the level plain, fixed stakes to mark the route of the portage, till he passed a large ravine, which would oblige us to make the portage farther from the river: after this, there being no other obstacle, he went to the river where he had first struck it, and took its courses and distances down to the camp. From the draught and survey of Captain Clarke, we had now a clear and connected view of the falls, cascades, and rapids of the Missouri.

This river is three hundred yards wide at the point where it receives the waters of Medicine river, which is one hundred and thirty-seven yards in width. The united current continues three hundred and twenty-eight poles to a small rapid on the north side, from which it gradually widens to one thousand four hundred yards, and at the distance of five hundred and forty-eight poles reaches the head of the rapids, narrowing as it approaches them. Here the hills on the north, which had withdrawn from the bank, closely border the river, which, for the space of three hundred and twenty poles, makes its way over the rocks with a descent of thirty feet: in this course the current is contracted to five hundred and eighty yards, and after throwing itself over a small pitch of five feet, forms a beautiful cascade of twenty-six feet five inches; this does not however fall immediately perpendicular, being stopped by a part of the rock which projects at about one-third of the distance. After descending this fall, and pas-

sing the cotton-wood island on which the eagle has fixed its nest, the river goes on for five hundred and thirty-two poles over rapids and little falls, the estimated descent of which is thirteen feet six inches till it is joined by a large fountain boiling up underneath the rocks near the edge of the river, into which it falls with a cascade of eight feet. It is of the most perfect clearness and rather of a bluish cast: and even after falling into the Missouri it preserves its colour for half a mile. From this fountain the river descends with increased rapidity for the distance of two hundred and fourteen poles, during which the estimated descent is five feet: from this for a distance of one hundred and thirty-five poles, the river descends fourteen feet seven inches, including a perpendicular fall of six feet seven inches. The river has now become pressed into a space of four hundred and seventy-three yards, and here forms a grand cataract by falling over a plain rock the whole distance across the river to the depth of forty-seven feet eight inches: after recovering itself the Missouri then proceeds with an estimated descent of three feet, till at the distance of one hundred and two poles it again is precipitated down the Crooked falls of nineteen feet perpendicular; below this at the mouth of a deep ravine is a fall of five feet, after which, for the distance of nine hundred and seventy poles the descent is much more gradual, not being more than ten feet, and then succeeds a handsome level plain for the space of one hundred

and seventy-eight poles with a computed descent of three feet, making a bend towards the north. Thence it descends during four hundred and eighty poles, about eighteen feet and a half, when it makes a perpendicular fall of two feet, which is ninety poles beyond the great cataract, in approaching which it descends thirteen feet within two hundred yards, and gathering strength from its confined channel, which is only two hundred and eighty yards wide, rushes over the fall to the depth of eighty-seven feet and three quarters of an inch. After raging among the rocks and losing itself in foam, it is compressed immediately into a bed of ninety-three yards in width: it continues for three hundred and forty poles to the entrance of a run or deep ravine where there is a fall of three feet, which, joined to the decline of the river during that course, makes the descent six feet. As it goes on, the descent within the next two hundred and forty poles is only four feet: from this passing a run or deep ravine the descent for four hundred poles is thirteen feet; within two hundred and forty poles a second descent of eighteen feet; thence one hundred and sixty poles a descent of six feet; after which, to the mouth of Portage creek, a distance of two hundred and eighty poles, the descent is ten feet. From this survey and estimate it results that the river experiences a descent of three hundred and fifty-two feet in the course of two and three quarter miles, from the commencement of the rapids to the mouth of

Portage creek, exclusive of almost impassable rapids which extend for a mile below its entrance.

The latitude of our camp below the entrance of Portage creek, was found to be $47^{\circ} 7' 10'' 3$, as deduced from a meridian altitude of the sun's lower limb taken with an octant by back observation, giving $53^{\circ} 10'$.

Friday, June 21. Having made the necessary preparations for continuing our route, a part of the baggage was carried across the creek into the high plain, three miles in advance, and placed on one of the carriages with truck wheels: the rest of the party was employed in drying meat and dressing elk skins. We killed several mule deer and an elk, and observed as usual vast quantities of buffalo who came to drink at the river. For the first time on the Missouri we have seen near the Falls a species of fishing duck, the body of which is brown and white, the wings white, and the head and upper part of the neck of a brick red, with a narrow beak, which seems to be of the same kind common in the Susquehanna, Potomac and James' river. The little wood which this neighbourhood affords consists of the broad and narrow-leaved cottonwood, the box alder, the narrow and broad-leaved willow, the large or sweet willow, which was not common below Maria's river, but which here attains the same size and has the same appearance as in the Atlantic states. The undergrowth consists of roses, gooseberries, currants, small honeysuckles, and the red-wood, the inner part of which

the *engagees* or watermen are fond of smoking when mixed with tobacco.

Saturday, 22. We now set out to pass the Portage and halted for dinner at eight miles distance near a little stream. The axletrees of our carriage, which had been made of an old mast, and the cotton-wood tongues, broke before we came there: but we renewed them with the timber of the sweet willow, which lasted till within half a mile of our intended camp, when the tongues gave way and we were obliged to take as much baggage as we could carry on our backs down to the river, where we formed an encampment in a small grove of timber opposite to the Whitebear islands. Here the banks on both sides of the river are handsome, level, and extensive; that near our camp is not more than two feet above the surface of the water. The river is about eight hundred yards wide just above these islands, ten feet deep in most places, and with a very gentle current. The plains however on this part of the river are not so fertile as those from the mouth of the Muscleshell and thence downwards; there is much more stone on the sides of the hills and on the broken lands than is to be found lower down. We saw in the plains vast quantities of buffalo, a number of small birds, and the large brown curlew, which is now sitting, and lays its eggs, which are of a pale blue with black specks, on the ground without any nest. There is also a species of lark much resembling the bird called the old field lark, with a yellow breast and

a black spot on the croup; though it differs from the latter in having its tail formed of feathers of an unequal length and pointed; the beak too is somewhat longer and more curved, and the note differs considerably. The prickly pear annoyed us very much to-day by sticking through our moccasins. As soon as we had kindled our fires we examined the meat which Captain Clarke had left here, but found that the greater part of it had been taken by the wolves.

Sunday, 23. After we had brought up the canoe and baggage Captain Clarke went down to the camp at Portage creek, where four of the men had been left with the Indian woman. Captain Lewis during the morning prepared the camp, and in the afternoon went down in a canoe to Medicine river to look after the three men who had been sent thither to hunt on the 19th, and from whom nothing had as yet been heard. He went up the river about half a mile and then walked along on the right bank, hallooing as he went, till at the distance of five miles he found one of them who had fixed his camp on the opposite bank, where he had killed seven deer, and dried about six hundred pounds of buffaloe meat, but had killed no elk. the animal chiefly wanted. He knew nothing of his companions, except that on the day of their departure from camp, he had left them at the Falls and come on to Medicine river, not having seen them since. As it was too late to return Captain Lewis passed over on a raft which he made for the

purpose, and spent the night at Shannon's camp, and the next morning,

Monday, 24th, sent J. Fields up the river with orders to go four miles and return, whether he found the two absent hunters or not, then descending the south-west side of Medicine river, he crossed the Missouri in the canoe, and sent Shannon back to his camp to join Fields and bring the meat which they had killed: this they did, and arrived in the evening at the camp on Whitebear islands. A part of the men from Portage creek also arrived with two canoes and baggage. On going down yesterday Captain Clarke cut off several angles of the former route, so as to shorten the Portage considerably, and marked it with stakes: he arrived there in time to have two of the canoes carried up in the high plain about a mile in advance. Here they all repaired their moccasins, and put on double soles to protect them from the prickly pear and from the sharp points of earth which have been formed by the trampling of the buffaloe during the late rains: this of itself is sufficient to render the Portage disagreeable to one who had no burthen; but as the men are loaded as heavily as their strength will permit, the crossing is really painful; some are limping with the soreness of their feet, others are scarcely able to stand for more than a few minutes from the heat and fatigue: they are all obliged to halt and rest frequently, and at almost every stopping place they fall and many of them are asleep in an instant; yet no one complains, and they go on

with great cheerfulness. At their camp Drewyer and Fields joined them, and while Captain Lewis was looking for them at Medicine river, they returned to report the absence of Shannon, about whom they been very uneasy. They had killed several buffaloe at the bend of the Missouri above the Falls: and dried about eight hundred pounds of meat and got one hundred pounds of tallow: they had also killed some deer, but had seen no elk. After getting the party in motion with the canoes, Captain Clarke returned to his camp at Portage creek.

We were now occupied in fitting up a boat of skins, the frame of which had been prepared for the purpose at Harper's ferry. It was made of iron, thirty-six feet long, four feet and a half in the beam, and twenty-six inches wide in the bottom. Two men had been sent this morning for timber to complete it, but they could find scarcely any even tolerably straight sticks four and a half feet long, and as the cotton-wood is too soft and brittle, we were obliged to use the willow and box-alder.

Tuesday, 25. The party returned to the lower camp. Two men were sent on the large island to look for timber. J. Fields was sent up the Missouri to hunt elk; but he returned about noon and informed us that a few miles above he saw two white bear near the river, and in attempting to fire at them came suddenly on a third, who being only a few steps off immediately attacked him; that in running to escape from the monster he leaped down a steep bank of the river, where

falling on a bar of stone, he cut his hand and knee and bent his gun; but fortunately for him the bank concealed him from his antagonist, or he would have been most probably lost. The other two returned with a small quantity of bark and timber, which were all they could find on the island; but they had killed two elk: these were valuable, as we were desirous of procuring the skins of that animal in order to cover the boat, as they are more strong and durable than those of the buffaloe, and do not shrink so much in drying. The party that went to the lower camp had one canoe and the baggage carried into the high plain to be ready in the morning, and then all who could make use of their feet had a dance on the green to the music of a violin. We have been unsuccessful in our attempt to catch fish; nor does there seem to be any in this part of the river. We observe a number of water terrapins. There are great quantities of young blackbirds in these islands just beginning to fly. Among the vegetable productions we observe a species of wild rye, which is now heading: it rises to the height of eighteen or twenty inches, the beard remarkably fine and soft; the culen is jointed, and in every respect in height it resembles the wild rye. Great quantities of mint too, like the peppermint, are found here.

The winds are sometimes violent in these plains. The men inform us, that as they were bringing one of the canoes along on truck-wheels, they hoisted

the sail, and the wind carried her along for some distance.

Wednesday, 26. Two men were sent on the opposite side of the river for bark and timber, of which they procured some, but by no means enough for our purposes. The bark of the cotton-wood is too soft, and our only dependence is on the sweet willow, which has a tough strong bark: the two hunters killed seven buffaloe. A party arrived from below with two canoes and baggage, and the wind being from the south-east, they had made considerable progress with the sails. On their arrival, one of the men who had been considerably heated and fatigued, swallowed a very hearty draught of water, and was immediately taken ill; Captain Lewis bled him with a penknife, having no other instrument at hand, and succeeded in restoring him to health the next day. Captain Clarke formed a second cache or deposit near the camp, and placed the swivel under the rocks near the river. The antelopes are still scattered through the plains; the females with their young, which are generally two in number, and the males by themselves.

Thursday, 27. The party were employed in preparing timber for the boat, except two, who were sent to hunt. About one in the afternoon a cloud arose from the south-west, and brought with it violent thunder, lightning, and hail: soon after it passed the hunters came in from about four miles above us. They had killed nine elk, and three

bear. As they were hunting on the river they saw a low ground covered with thick brushwood, where from the tracks along shore they thought a bear had probably taken refuge: they therefore landed, without making noise, and climbed a tree about twenty feet above the ground. Having fixed themselves securely, they raised a loud shout, and a bear instantly rushed towards them. These animals never climb, and therefore when he came to the tree and stopped to look at them, Drewyer shot him in the head; he proved to be the largest we have yet seen; his noise appeared to be like that of a common ox; his fore-feet measured nine inches across, and the hind-feet were seven inches wide, and eleven and three quarters long, exclusive of the talons. One of these animals came within thirty yards of the camp last night, and carried off some buffaloe meat which we had placed on a pole. In the evening after the storm the water on this side of the river became of a deep crimson colour, probably caused by some stream above washing down a kind of soft red stone, which we observed in the neighbouring bluffs and gullies. At the camp below, the men who left us in the morning were busy in preparing their load for to-morrow, but were impeded by the rain, hail, and hard wind from the north-west.

Friday, 28. The party all occupied in making the boat; they obtained a sufficient quantity of willow bark to line her, and over these were placed the elk skins, and when they failed we were obliged

to use the buffaloe hide. The white bear have now become exceedingly troublesome; they constantly infest our camp during the night; and though they have not attacked us, as our dog who patrols all night gives us notice of their approach, yet we are obliged to sleep with our arms by our sides for fear of accident, and we cannot send one man alone to any distance, particularly if he has to pass through brush-wood. We saw two of them to-day on the large island opposite to us, but as we are all so much occupied now, we mean to reserve ourselves for some leisure moment, and then make a party to drive them from the islands. The river has risen nine inches since our arrival here.

At Portage creek Captain Clarke completed the cache, in which we deposited whatever we could spare from our baggage; some ammunition, provisions, books, the specimens of plants and minerals, and a draught of the river from its entrance to fort Mandan. After closing it he broke up the encampment, and took on all the remaining baggage to the high plain, about three miles. Portage creek has risen considerably in consequence of the rain, and the water had become of a deep crimson colour, and ill-tasted: on overtaking the canoe he found that there was more baggage than could be carried on the two carriages, and therefore left some of the heavy articles which could not be injured, and proceeded on to Willow-run, where he encamped for the night. Here they made a supper on two buffaloe which they killed on the way; but passed the

night in the rain, with a high wind from the southwest. In the morning,

Saturday, 29, finding it impossible to reach the end of the Portage with their present load, in consequence of the state of the road after the rain, he sent back nearly all his party to bring on the articles which had been left yesterday. Having lost some notes and remarks which he had made on first ascending the river, he determined to go up to the Whitebear islands along its banks, in order to supply the deficiency. He there left one man to guard the baggage, and went on to the Falls, accompanied by his servant York, Chaboneau and his wife with her young child. On his arrival there he observed a very dark cloud rising in the west which threatened rain, and looked around for some shelter, but could find no place where they would be secure from being blown into the river, if the wind should prove as violent as it sometimes does in the plains. At length, about a quarter of a mile above the Falls, he found a deep ravine, where there were some shelving rocks, under which he took refuge. They were on the upper side of the ravine near the river, perfectly safe from the rain, and therefore laid down their guns, compass, and other articles which they carried with them. The shower was at first moderate, it then increased to a heavy rain, the effects of which they did not feel: soon after a torrent of rain and hail descended; the rain seemed to fall in a solid mass, and instantly collecting in the ravine, came rolling down in a

dreadful current, carrying the mud and rocks, and every thing that opposed it. Captain Clarke fortunately saw it a moment before it reached them, and springing up with his gun and shot-pouch in his left hand, with his right clambered up the steep bluff, pushing on the Indian woman with her child in her arms; her husband too had seized her hand, and was pulling her up the hill, but he was so terrified at the danger, that but for Captain Clarke, himself and his wife and child would have been lost. So instantaneous was the rise of the water, that before Captain Clarke had reached his gun and began to ascend the bank, the water was up to his waist, and he could scarce get up faster than it rose, till it reached the height of fifteen feet with a furious current, which, had they waited a moment longer, would have swept them into the river just above the Great Falls, down which they must inevitably have been precipitated. They reached the plain in safety, and found York, who had separated from them just before the storm to hunt some buffaloe, and was now returning to find his master. They had been obliged to escape so rapidly, that Captain Clarke lost his compass and umbrella, Chaboneau left his gun, shot-pouch, and tomahawk, and the Indian woman had just time to grasp her child, before the net in which it lay at her feet was carried down the current. He now relinquished his intention of going up the river, and returned to the camp at Willow-run. Here he found that the party sent this morning

for the baggage, had all returned to camp in great confusion, leaving their loads in the plain. On account of the heat they generally go nearly naked, and with no covering on their heads. The hail was so large, and driven so furiously against them by the high wind, that it knocked several of them down: one of them particularly was thrown on the ground three times, and most of them bleeding freely, and complained of being much bruised. Willow-run had risen six feet since the rain, and as the plains were so wet that they could not proceed, they passed the night at their camp.

At the Whitebear camp also, we had not been insensible to the hail-storm, though less exposed. In the morning there had been a heavy shower of rain, after which it became fair. After assigning to the men their respective employments, Captain Lewis took one of them and went to see the large fountain near the Falls. For about six miles he passed through a beautiful level plain, and then on reaching the break of the river-hills, was overtaken by a gust of wind from the south-west, attended by lightning, thunder, and rain: fearing a renewal of the scene on the 27th, they took shelter in a little gully, where there were some broad stones, with which they meant to protect themselves against the hail; but fortunately there was not much, and that of a small size; so that they felt no inconvenience, except that of being exposed without shelter for an hour, and being drenched by the rain: after it was over they proceeded to the foun-

tain, which is perhaps the largest in America. It is situated in a pleasant level plain, about twenty-five yards from the river, into which it falls over some steep irregular rocks, with a sudden ascent of about six feet in one part of its course. The water boils up from among the rocks, and with such force near the centre, that the surface seems higher there than the earth on the sides of the fountain, which is a handsome turf of fine green grass. The water is extremely pure, cold, and pleasant to the taste, not being impregnated with lime or any foreign substance. It is perfectly transparent, and continues its blueish cast for half a mile down the Missouri, notwithstanding the rapidity of the river. After examining it for some time, Captain Lewis returned to the camp.

Sunday, 30. In the morning, Captain Clarke sent the men to bring up the baggage left in the plains yesterday. On their return the axle-trees and carriages were repaired, and the baggage conveyed on the shoulders of the party across Willow-run, which had fallen as low as three feet. The carriages being then taken over, a load of baggage was carried to the six-mile stake, deposited there, and the carriages brought back. Such is the state of the plains, that this operation consumed the day. Two men were sent to the Falls to look for the articles lost yesterday; but they found nothing but the compass, covered with mud and sand at the mouth of the ravine: the place at which Captain Clarke had been caught by the storm, was

filled with large rocks. The men complain much of the bruises received yesterday from the hail. A more than usual number of buffaloe appeared about the camp to-day, and furnished plenty of meat: Captain Clarke thought that at one view he must have seen at least ten thousand. In the course of the day there was a heavy gust of wind from the south-west, after which the evening was fair.

At the Whitebear camp we had a heavy dew this morning, which is quite a remarkable occurrence. The party continues to be occupied with the boat, the cross-bars for which are now finished, and there remain only the strips to complete the wood-work: the skins necessary to cover it have already been prepared, and they amount to twenty-eight elk skins and four buffaloe skins. Among our game were two beaver, which we have had occasion to observe always are found wherever there is timber. We also killed a large bat or goatsucker, of which there are many in this neighbourhood, resembling in every respect those of the same species in the United States. We have not seen the leather-winged bat for some time, nor are there any of the small goatsucker in this part of the Missouri. We have not seen either that species of goatsucker or nighthawk called the whip-poor-will, which is commonly confounded in the United States with the large goatsucker which we observe here; this last prepares no nest, but lays its eggs in the open plains; they generally begin to sit on

two eggs, and we believe raise only one brood in a season: at the present moment they are just hatching their young.

Monday, July 1. After a severe day's work Captain Clarke reached our camp in the evening, accompanied by his party and all the baggage, except that left at the six-mile stake, for which they were too much fatigued to return. The route from the lower camp on Portage creek to that near Whitebear island, having been now measured and examined by Captain Clarke, was as follows:

From our camp opposite the last considerable rapid to the entrance of Portage creek south 9° east for three quarters of a mile: thence on a course south 10° east for two miles, though for the canoes the best route is to the left of this course, and strikes Portage one mile and three quarters from its entrance, avoiding in this way a very steep hill which lies above Portage creek: from this south 18° west for four miles, passing the head of a drain or ravine which falls into the Missouri below the Great Falls, and to the Willow-run, which has always a plentiful supply of good water and some timber: here the course turns to south 45° west for four miles further; then south 66° west three miles, crossing at the beginning of the course the head of a drain which falls into the Missouri at the Crooked Falls, and reaching an elevated point of the plain from which south 42° west. On approaching the river on this course there is a long and gentle descent from the high

plain, after which the road turns a little to the right of the course up the river to our camp. The whole Portage is seventeen and three quarter miles.

At the Whitebear camp we were occupied with the boat and digging a pit for the purpose of making some tar. The day has been warm, and the mosquitoes troublesome. We were fortunate enough to observe equal altitudes of the sun with a sextant, which since our arrival here we have been prevented from doing, by flying clouds and storms in the evening.

Tuesday, July 2. A shower of rain fell very early this morning. We then dispatched some men for the baggage left behind yesterday, and the rest were engaged in putting the boat together. This was accomplished in about three hours, and then we began to sew on the leather over the cross-bars of iron on the inner side of the boat, which form the ends of the sections. By two o'clock the last of the baggage arrived, to the great delight of the party, who were anxious to proceed. The mosquitoes we find very troublesome.

Having completed our celestial observations we went over to the large island to make an attack upon its inhabitants the bears, who have annoyed us very much of late, and who were prowling about our camp all last night. We found that the part of the island frequented by the bear forms an almost impenetrable thicket of the broad-leaved willow: into this we forced our way in parties of

three; but could see only one bear, who instantly attacked Drewyer. Fortunately as he was rushing on, the hunter shot him through the heart within twenty paces, and he fell, which enabled Drewyer to get out of his way: we then followed him one hundred yards and found that the wound had been mortal. Not being able to discover any more of these animals were turned to camp: here, in turning over some of the baggage, we caught a rat, somewhat larger than the common European rat, and of a lighter colour; the body and outer parts of the legs and head of a light lead colour; the inner side of the legs, as well as the belly, feet, and ears, are white; the ears are not covered with hair, and are much larger than those of the common rat; the toes also are longer, the eyes black and prominent, the whiskers very long and full; the tail rather longer than the body, and covered with fine fur and hair of the same size with that on the back, which is very close, short, and silky in its texture. This was the first we had met, although its nests are very frequent among the cliffs of rocks and hollow trees, where we also found large quantities of the shells and seed of the prickly pear, on which we conclude they chiefly subsist. The musquitoes are uncommonly troublesome. The wind was again high from the south-west: these winds are in fact always the coldest and most violent which we experience, and the hypothesis which we have formed on that subject is that the air coming in contact with the Snowy mountains immediately

becomes chilled and condensed, and being thus rendered heavier than the air below, it descends into the rarefied air below, or into the vacuum formed by the constant action of the sun on the open unsheltered plains. The clouds rise suddenly near these mountains and distribute their contents partially over the neighbouring plains. The same cloud will discharge hail alone in one part, hail and rain in another, and rain only in a third, and all within the space of a few miles; while at the same time there is snow falling on the mountains to the south-east of us. There is at present no snow on those mountains; that which covered them on our arrival, as well as that which has since fallen, having disappeared. The mountains to the north and north-west of us are still entirely covered with snow, and indeed there has been no perceptible diminution of it since we first saw them, which induces a belief either that the clouds prevailing at this season do not reach their summits, or that they deposit their snow only. They glisten with great beauty when the sun shines on them in a particular direction, and most probably from this glittering appearance have derived the name of the Shining mountains.

Wednesday, 3. Nearly the whole party were employed in different labours connected with the boat, which is now almost completed: but we have not as yet been able to obtain tar from our kiln, a circumstance that will occasion us not a little embarrassment. Having been told by the Indians that on leaving the Falls we should soon pass the buf-

faloe country, we have before us the prospect of fasting occasionally; but in order to provide a supply we sent out the hunters, who killed only a buffalo and two antelopes, which added to six beaver and two otter have been all our game for two or three days. At ten in the morning we had a slight shower, which scarcely wetted the grass.

Thursday, July 4. The boat was now completed, except what was in fact the most difficult part, the making her seams secure. We had intended to dispatch a canoe with part of our men to the United States early this spring; but not having yet seen the Snake Indians, or known whether to calculate on their friendship or enmity, we have decided not to weaken our party, which is already scarcely sufficient to repel any hostility. We were afraid too that such a measure might dishearten those who remain; and as we have never suggested it to them, they are all perfectly and enthusiastically attached to the enterprise, and willing to encounter any danger to ensure its success. We had a heavy dew this morning.

Since our arrival at the Falls we have repeatedly heard a strange noise coming from the mountains in a direction a little to the north of west. It is heard at different periods of the day and night, sometimes when the air is perfectly still and without a cloud, and consists of one stroke only, or of five or six discharges in quick succession. It is loud, and resembles precisely the sound of a six-pound piece of ordnance at the distance of three miles. The

Minnetarees frequently mentioned this noise like thunder, which they said the mountains made; but we had paid no attention to it, believing it to have been some superstition or perhaps a falsehood. The watermen also of the party say that the Pawnees and Ricaras give the same account of a noise heard in the Black mountains to the westward of them. The solution of the mystery given by the philosophy of the watermen is, that it is occasioned by the bursting of the rich mines of silver confined within the bosom of the mountain. An elk and a beaver are all that were killed to-day: the buffalo seemed to have withdrawn from our neighbourhood, though several of the men who went to-day to visit the Falls, for the first time, mention that they are still abundant at that place. We contrived however to spread not a very sumptuous but a comfortable table in honour of the day, and in the evening gave the men a drink of spirits, which was the last of our stock. Some of them appeared sensible to the effects of even so small a quantity, and as is usual among them on all festivals, the fiddle was produced and a dance begun, which lasted till nine o'clock, when it was interrupted by a heavy shower of rain. They continued however their merriment till a late hour.

Friday, 5. The boat was brought up into a high situation and fires kindled under her, in order to dry her more expeditiously. Despairing now of procuring any tar, we formed a composition of pounded charcoal with bees-wax and buffalo tallow

to supply its place ; should this resource fail us it will be very unfortunate, as in every other respect the boat answers our purposes completely. Although not quite dry she can be carried with ease by five men ; her form is as complete as could be wished ; very strong, and will carry at least eight thousand pounds with her complement of hands. Besides our want of tar, we have been unlucky in sewing the skins with a needle which had sharp edges instead of a point merely, although a large thong was used in order to fill the hole, yet it shrinks in drying and leaves the hole open, so that we fear the boat will leak.

A large herd of buffaloe came near us and we procured three of them : besides which were killed two wolves and three antelopes. In the course of the day other herds of buffaloe came near our camp on their way down the river : these herds move with great method and regularity. Although ten or twelve herds are seen scattered from each other over a space of many miles, yet if they are undisturbed by pursuit they will be uniformly travelling in the same direction.

Saturday, 6. Last night there were several showers of rain and hail, attended with thunder and lightning : and about day-break a heavy storm came on from the south-west with one continued roar of thunder, and rain and hail. The hail, which was as large as musket balls, covered the ground completely ; and on collecting some of it, it lasted during the day and served to cool the

water. The red and yellow currant is abundant, and now ripe, although still a little acid. We have seen in this neighbourhood what we have not met before, a remarkably small fox, which associates in bands and burrows in the prairie, like the small wolf, but have not yet been able to obtain any of them, as they are extremely vigilant, and betake themselves on the slightest alarm to their burrows, which are very deep.

Sunday, 7. The weather is warm but cloudy, so that the moisture retained by the bark after the rain leaves it slowly, though we have small fires constantly under the boat. We have no tents, and therefore are obliged to use the sails to keep off the bad weather. Our buffaloe skins too, are scarcely sufficiently to cover our baggage, but the men are now dressing others to replace their present leather clothing, which soon rots by being so constantly exposed to water. In the evening the hunters returned with the skins of only three buffaloe, two antelope, four deer, and three wolf skins, and reported that the buffaloe had gone further down the river ; two other hunters, who left us this morning, could find nothing except one elk : in addition to this we caught a beaver. The musquitoes still disturb us very much, and the blowing flies swarm in vast numbers round the boat. At four in the afternoon we had a light shower of rain, attended with some thunder and lightning.

Monday, 8. In order more fully to replace the notes of the river which he had lost, and which he

was prevented from supplying by the storm of the twenty-ninth ult. Captain Clarke set out after breakfast, taking with him nearly the whole party with a view of shooting buffaloe, if there should be any near the Falls. After getting some distance in the plains the men were divided into squads, and he with two others struck the Missouri at the entrance of Medicine river, and thence proceeded down to the great cataract. He found that the immense herds of buffaloe have entirely disappeared, and he thought had gone below the Falls. Having made the necessary measurements, he returned through the plains and reached camp late in the evening; the whole party had killed only three buffaloe, three antelopes and a deer; they had also shot a small fox, and brought a living ground-squirrel, somewhat larger than those of the United States.

The day was warm and fair, but a slight rain fell in the afternoon. The boat having now become sufficiently dry, we gave it a coat of the composition, which, after a proper interval, was repeated, and the next morning,

Tuesday 9, she was launched into the water, and swam perfectly well: the seats were then fixed and the oars fitted; but after we had loaded her, as well as the canoes, and were on the point of setting out, a violent wind caused the waves to wet the baggage, so that we were forced to unload them. The wind continued high till evening, when to our great disappointment we discovered that nearly all

the composition had separated from the skins, and left the seams perfectly exposed; so that the boat now leaked very much. To repair this misfortune without pitch is impossible, and as none of that article is to be procured, we therefore, however reluctantly, are obliged to abandon her, after having had so much labour in the construction. We now saw that the section of the boat covered with buffaloe skins on which hair had been left, answered better than the elk skins, and leaked but little; while that part which was covered with hair about one-eighth of an inch, retained the composition perfectly, and remained sound and dry. From this we perceived that had we employed buffaloe instead of elk skins, and not singed them so closely as we have done, carefully avoiding to cut the leather in sewing, the boat would have been sufficient even with the present composition, or had we singed instead of shaving the elk skins, we might have succeeded. But we discovered our error too late: the buffaloe had deserted us, the travelling season was so fast advancing that we had no time to spare for experiments, and therefore finding that she could be no longer useful she was sunk in the water, so as to soften the skins, and enable us the more easily to take her to pieces. It now became necessary to provide other means for transporting the baggage which we had intended to stow in her. For this purpose we shall want two canoes, but for many miles from below the mouth of the Musc-

shell river to this place, we have not seen a single tree fit to be used in that way. The hunters however who had hitherto been sent after timber, mention that there is a low ground on the opposite side of the river, about eight miles above us by land, and more than twice that distance by water, in which we may probably find trees large enough for our purposes. Captain Clarke therefore determined to set out by land for that place with ten of the best workmen, who would be occupied in building the canoes, till the rest of the party, after taking the boat to pieces and making the necessary deposits, should transport the baggage and join them with the other six canoes.

Wednesday, 10. He accordingly passed over to the opposite side of the river with his party, and proceeded on eight miles by land, the distance by water being twenty-three and three quarter miles. Here he found two cotton-wood trees, but on cutting them down one proved to be hollow, split at the top in falling, and both were much damaged at the bottom. He searched the neighbourhood, but could find none that would suit better, and therefore was obliged to make use of those which he had felled, shortening them in order to avoid the cracks, and supplying the deficiency by making them as wide as possible. They were equally at a loss for wood of which they might make handles for their axes, the eyes of which not being round, they were obliged to split the timber in such a manner that

thirteen of the handles broke in the course of the day, though made of the best wood they could find for the purpose, which was the chokecherry.

The rest of the party took the frame of the boat to pieces, deposited it in a cache or hole, with a draught of the country from Fort Mandan to this place, and also some other papers and small articles of less importance. After this we amused ourselves with fishing, and although we had thought on our arrival that there were none in this part of the river, we caught some of a species of white chub below the Falls, but few in number, and small in size.

Sergeant Ordway with four canoes and eight men had set sail in the morning, with part of the baggage, to the place where Captain Clarke had fixed his camp, but the wind was so high that he only reached within three miles of that place, and encamped for the night.

Thursday, July 11. In the morning one of the canoes joined Captain Clarke: the other three having on board more valuable articles, which would have been injured by the water, went on more cautiously, and did not reach the camp till the evening. Captain Clarke then had the canoes unloaded and sent back, but the high wind prevented their floating down nearer than about eight miles above us. His party were busily engaged with the canoes, and their hunters supplied them with three fat deer and a buffaloe, in addition to two deer and an antelope killed yesterday. The few men who were with Captain Lewis were occupied in hunting, but with

not much success, having killed only one buffaloe. They heard about sun-set two discharges of the tremendous mountain artillery: they also saw several very large grey eagles, much larger than those of the United States, and most probably a distinct species, though the bald eagle of this country is not quite so large as that of the United States. The men have been much afflicted with painful whitlows, and one of them disabled from working by this complaint in his hand.

Friday, 12. In consequence of the wind the canoes did not reach the lower camp till late in the afternoon, before which time Captain Lewis sent all the men he could spare up the river to assist in building the boats, and the day was too far advanced to reload and send them up before morning. The musquitoes are very troublesome, and they have a companion not less so, a large black gnat, which does not sting, but attacks the eyes in swarms. The party with Captain Clarke are employed on the canoes: in the course of the work Sergeant Pryor dislocated his shoulder yesterday, but it was replaced immediately, and though painful does not threaten much injury. The hunters brought in three deer and two otter. This last animal has been numerous since the water has become sufficiently clear for them to take fish. The blue-crested fisher, or, as it is sometimes called, the king-fisher, is an inhabitant of this part of the river; it is a bird rare on the Missouri; indeed we had not seen more than three or four of them from its entrance to

Maria's river, and even those did not seem to reside on the Missouri, but on some of the clearer streams which empty into it, as they were seen near the mouths of those streams.

Saturday, 13. The morning being fair and calm, Captain Lewis had all the remaining baggage embarked on board the six canoes, which sailed with two men in each for the upper camp. Then, with a sick man and the Indian woman, he left the encampment, and crossing over the river went on by land to join Captain Clarke. From the head of the Whitebear islands, he proceeded in a south-west direction, at the distance of three miles, till he struck the Missouri, which he then followed till he reached the place where all the party were occupied in boat-building. On his way he passed a very large Indian lodge, which was probably designed as a great council-house, but it differs in its construction from all that we have seen lower down the Missouri or elsewhere. The form of it was a circle two hundred and sixteen feet in circumference at the base, and composed of sixteen large cotton-wood poles about fifty feet long, and at their thicker ends, which touched the ground, about the size of a man's body: they were distributed at equal distances, except that one was omitted to the east, probably for the entrance. From the circumference of this circle the poles converged towards the centre, where they were united and secured by large withes of willow brush. There was no covering over this fabric, in the centre of which were the remains of

a large fire, and round it the marks of about eighty leathern lodges. He also saw a number of turtle-doves, and some pigeons, of which he shot one differing in no respect from the wild pigeon of the United States. The country exhibits its usual appearances, the timber confined to the river, the country on both sides as far as the eye can reach being entirely destitute of trees or brush. In the low ground, in which we are building the canoes, the timber is larger and more abundant than we have seen it on the Missouri for several hundred miles. The soil too is good, for the grass and weeds reach about two feet high, being the tallest we have observed this season, though on the high plains and prairies the grass is at no season above three inches in height. Among these weeds are the sand-rush and nettle in small quantities; the plains are still infested by great numbers of the small birds already mentioned, among whom is the brown curlew. The current of the river is here extremely gentle; the buffaloe have not yet quite gone, for the hunters brought in three in very good order. It requires some diligence to supply us plentifully, for as we reserve our parched meal for the Rocky mountains, where we do not expect to find much more game, our principal article of food is meat, and the consumption of the whole thirty-two persons belonging to the party, amounts to four deer, an elk and a deer, or one buffaloe, every twenty-four hours. The mosquitoes and gnats persecute us as violently as below, so that

we can get no sleep unless defended by biers, with which we are all provided. We here found several plants hitherto unknown to us, and of which we preserved specimens.

Sergeant Ordway proceeded with the six canoes five miles up the river, but the wind becoming so high as to wet the baggage he was obliged to unload and dry it. The wind abated at five o'clock in the evening, when he again proceeded eight miles and encamped. The next morning,

Sunday, July 14, he joined us about noon. On leaving the Whitebear camp he passed at a short distance a little creek or run coming in on the left. This had been already examined, and called Flattery run; it contains back water, only, with very extensive low grounds, which rising into large plains reach the mountains on the east; then passed a willow island on the left within one mile and a half, and reached, two miles further, a cliff of rocks in a bend on the same side. In the course of another mile and a half he passed two islands covered with cotton-wood, box-alder, sweet-willow, and the usual undergrowth, like that of the Whitebear islands. At thirteen and three quarter miles he came to the mouth of a small creek on the left; within the following nine miles he passed three timbered islands; and after making twenty-three and a quarter miles from the lower camp, arrived at the point of woodland on the north, where the canoes were constructed.

The day was fair and warm; the men worked

very industriously, and were enabled by the evening to launch the boats, which now want only seats and oars to be complete. One of them is twenty-five, the other thirty-three feet in length and three feet wide. Captain Lewis walked out between three and four miles over the rocky bluffs to a high situation, two miles from the river, a little below Fort Mountain creek. The country which he saw was in most parts level, but occasionally became varied by gentle rises and descents, but with no timber, except along the water. From this position, the point at which the Missouri enters the first chain of the Rocky mountains bore south 28° west about twenty-five miles, according to our estimate.

The northern extremity of that chain north 73° west at the distance of eighty miles.

To the same extremity of the second chain north 65° west one hundred and fifty miles.

To the most remote point of a third and continued chain of these mountains north 50° west about two hundred miles.

The direction of the first chain was from south to 20° east to north 20° west; of the second, from south 45° east to north 45° west; but the eye could not reach their southern extremities, which most probably may be traced to Mexico. In a course south 75° west, and at the distance of eight miles, is a mountain, which from its appearance we shall call Fort Mountain. It is situated in the level plain, and forms nearly a square, each side of which is a mile in extent. These sides, which are composed

of a yellow clay, with no mixture of rock or stone whatever, rise perpendicularly to the height of three hundred feet, where the top becomes a level plain, covered, as Captain Lewis now observed, with a tolerably fertile mould two feet thick, on which was a coat of grass similar to that of the plain below: it has the appearance of being perfectly inaccessible, and although the mounds near the Falls somewhat resemble it, yet none of them are so large.

END OF THE FIRST VOLUME.
